# Use this form to tap into the nation's largest computer file of top jobs

The National Manpower Register computer-based placement service is the largest employer-sponsored system of its kind. It provides a network of 87 offices throughout the nation — all of which have key contacts with leading employers in their area. Over 6500 employers with openings for computer professionals are represented. The NMR system does **not** charge either employers or applicants a fee to enter their qualifications and requirements into the on-line computer data base.

**In no case does an applicant pay a placement fee, or any other costs.**

*Fill in the form and send it immediately with a copy of your current resume to NMR, at the address below.*

(It is most important that your information be complete and accurate and that you TYPE or PRINT LEGIBLY.)

Name	Date	Have you ever registered with NMR before?	If so, when?

Growth is the message—

See RCA during the SJCC in Boston

The art, science and technology of computer hardware and software design are accelerating at an ever increasing speed at RCA. We're dedicated to long range programs of expansion in every area of this world-changing industry.

To continue the pace, we need people — EDP professionals like yourself — people who want to be part of a company that has the kind of broad technological range of RCA. This kind of broad based knowledge is already moving us ahead, while opening up more and more new

opportunities for advancement.

If you are connected with the computer industry in any way, you should get the full story from RCA.

We are looking for engineers and programmers in all areas of computer technology — scientific, military and commercial.

Specific areas of engineering are airborne computers, digital controlled automatic test equipment, memory systems, computer design, peripheral equipment design, switching and logic, and research.

Programmers with experience

in language processors, control systems, micro-programming, and scientific programming.

Other areas include field systems support, sales, marketing, and product planning.

Openings are throughout the United States and overseas.

**To arrange an interview in Boston, during the conference, call Mr. A. C. Bennett at (617) 267-5309.**

If you can't see us during the conference, write to him at RCA, Dept. SJ-1A, Building 2-4, Camden, New Jersey 08102. We are an equal opportunity employer.

**RCA**

# DATA PROCESSING TEXT BOOKS

## Introduction To Computer Programming IBM System 360/Assembler Language

AT LAST! A simplified, yet comprehensive textbook on Assembler Language programming with emphasis on the commercial Instruction set using DOS. Contents includes System/360 hardware and software, flowcharting and documentation, DTF's, input/output operations, comparing, addition, subtraction, multiplication, division, work areas, register usage, hundreds of illustrations — numerous sample programs carefully explained to illustrate assembler language programming concepts and techniques.

By: Thomas I. Cashman and Gary B. Shelly Only — \$7.95

## Introductory & Advanced Textbooks For System/360 RPG Programming

By: Dennis A. Fletcher and Thomas J. Cashman

NOW AVAILABLE: The first student textbooks written on this rapidly expanding programming language. All exercises, problems review questions, case studies and forms needed to learn RPG PROGRAMMING are included. Ideal for classroom use, in-plant training or home study.

Volume I Introduction — \$6.95, Volume II Advanced Concepts — \$3.95.

## Review Manual for Certificate in Data Processing 1969-Revised Edition By: Thomas J. Cashman CDP

ACCLAIMED throughout the country as the best single reference in preparing for the CDP EXAMINATION. INVALUABLE to persons employed in or associated with the field of Data Processing. The 1969 Revised Edition contains over 300 pages of Valuable information.

Only — \$7.95

## Basic Logic For Program Flowcharting And Table Search

By: Robert L. Jones and Gail Oliver

An introductory text covering the flowcharting logic for typical business applications — numerous sample flowcharts. Useful in all programming classes — takes the mystery out of Program Logic and Flowcharting.

Only — \$2.25

## "Let's get one thing straight, programmers... You can get ahead faster at Link!"

If you're looking for an exciting, new career opportunity, where you can become importantly and actively involved in challenging projects, look to Link.

We're looking for experienced personnel to design automation and systems software. Our specific requirements are a background of 3-4 years of scientific programming and expert command of machine language, as well as FORTRAN and COBOL. More to the point, we're looking for personnel who want an out-of-the-ordinary career, one where advancement is as rapid as you are talented.

You see, at Link you can't get lost in the shuffle. We can't afford to let you. We need all our resources to continue our dynamic expansion (though it is nice to be a part of a huge, world-wide organization, we're making it on our own).

Our external environment is something else, too. We're ideally located right in the heart of the San Francisco Peninsula, near Bay and ocean, redwood forest and wine country. Our nearby educational facilities are outstanding (Cal and Stanford) as is our cultural setting (minutes from The City).

*The opportunity to get ahead is here... the challenge is yours. To see if Link should be programmed into your future, send your confidential resume, including salary history and requirements, to: Mr. R. Nadzam, Employment Manager, Department SA, Link Division, Singer-General Precision, Inc., 1077 East Arques Avenue, Sunnyvale, California 94086.*

# *Can an EDP man attending SJCC find that better job without letting the world know he's looking? SURE HE CAN!*

SOFTWARE AGE Magazine's FREE Resume Center protects your privacy . . . speeds your search . . . costs you nothing!

1. Fill out the special resume form from magazine or at Center.

2. Our Dennison operator will photocopy the resume free and return all copies to you.

3. You place your resume in the company lock boxes of your choice.

Your job is simple. You follow the same procedure at the center that you do in S/A—but on a highly accelerated basis. Fill out the special resume form at the S/A RESUME CENTER. Our Dennison operators will provide you with as many *free* photo copies of your resume as you require.

You personally deposit them in the lock boxes of those companies which interest you. The resume form includes blanks where you can enter your hotel, telephone number and room number. Only the participating company representative has access to the lockbox. At his convenience, he can contact you at your hotel to arrange an interview.

The entire operation of the S/A RESUME CENTER is designed to provide speed, convenience, simplicity and maximum confidence with no middlemen involved. You determine exactly the companies you want—no others will see your resume or know of your interests.

The S/A RESUME CENTER is FREE. There is no charge to you or the company for this valuable service. The resume center is sponsored solely by the advertisers in SOFTWARE AGE magazine.

# A New Method of Representing Hexidecimal Numbers

by Vartan Khosharian

---

*Khosharian is a specialist in command and control computer systems with Lockheed Electronics Company, Houston Aerospace Division, Manned Spacecraft Center. He is a project leader for system programming of the computer aided communication analysis system used for the Apollo 8 Mission.*

*He has programmed ten different computers over the past twelve years, and holds a B.A. degree in mathematics from Arizona State University, Tempe, and has done graduate work at U.C.L.A.*

---

The basic numeration system employed in modern day digital computers is binary. Due to the alienation of the binary system with respect to the decimal system, the octal numeration system is utilized to impose a direct relation to binary numbers and yet allow a comfort level for the decimal numbers. In computer operation the binary digits are grouped in sets, called "words". It is convenient to reduce word size by employing the relation that exists between binary and octal notation. Two to the third power, for instance, may be represented in the octal system by eight to the first power. Thus the direct octal representation of a computer word is established and word size is reduced. As to the exact number of binary digits that should be used in a computer word, the computer designers are influenced by many factors such as cost, speed, processor logic, etc.

There are two basic types of digital computers, BCD and binary. The BCD (Binary Coded Decimal) has always been considered as the business problem solving orientated machine, whereas the binary computer has been considered as the specialist for scientific problem solving. The basic differences between these two computers are in the word organization and the processing logic, such as the adder unit. The BCD computer represents decimal digits by logically grouping a minimum of four binary digits in a computer word. The processing logic performs arithmetic operations in serial order by each decimal digit binary representation. The binary computer represents the exact value expressed in the number of digits in

a computer word. The processing logic performs arithmetic operations in parallel order on each binary digit.

At the beginning of the computer era, computer manufacturers produced BCD and binary computers as two separate and distinct machines. But as computers became more popular in the business world, with the rapid increase in information processing, the practice of manufacturing two different types of computers was abandoned. Manufacturers developed a computer to handle both business and scientific problems. This meant that the computer word organization would have to lean more toward the BCD repre-

sentation. As a result, the numbers of binary digits in a computer word is divisible by four and the external representation of these four binary digits is the hexadecimal numeration system. Unfortunately, the decimal system provides only ten symbols with which to express numbers. The Roman letters A, B, C, D, E, F are used to express the additional six symbols needed for a hexadecimal system.

It is very cumbersome to perform arithmetic operations utilizing the letters A, B, C, D, E and F. A more practical approach is to use a uniform system of pure numbers, thus eliminating the necessity for conversion to decimal and/or octal.

According to the scales of notation, any given hexadecimal number is expressed by the following algorithm:

$$N_{16} = a_0 16^0 + a_1 16^1 + a_2 16^2 + a_3 16^3 + \dots + a_n 16^n$$

where  $a_i < 16$  for  $i = 0, 1, 2, \dots, n$

The octal number is expressed as follows:

$$N_8 = b_0 8^0 + b_1 8^1 + b_2 8^2 + b_3 8^3 + \dots + b_n 8^n$$

where  $b_i < 8$  for  $i = 0, 1, 2, \dots, n$

Given the following bi-octal number algorithm,

$$N_{2 \times 8} = (C_0 8^0 + d_0 8^1) 2^0 + (C_1 8^1 + d_1 8^2) 2^1 + d_2 8^3) 2^2 + (C_3 8^3 + d_3 8^4) 2^3 + \dots + (C_n 8^n + d_n 8^{n+1}) 2^n$$

where  $c_i < 8$  and  $d_i = 0$  or  $1$  for  $i = 0, 1, 2, \dots, n$

if  $d_i = 1$  then  $N_{2 \times 8} = N_{16}$  where  $8 \leq a_i < 16$ ,

and

if  $d_i = 0$  then  $N_{2 \times 8} = N_{16}$  where  $0 \leq a_i < 8$ ,

# Programmers

SCIENTIFIC/COMMERCIAL

MOVE  
UP  
WITH  
VITRO

Our computers have flown a lot of missions in our work in V/STOL systems definition. It's one of many jobs supporting our work in systems engineering, research and development. Our IBM 360/30-7090-360/40 facility provides operations research, analysis and prediction, information retrieval, and systems simulation in development of ASW fire control techniques, advanced torpedo design, underwater acoustics, acoustic imaging, oceanographic communications studies, and missile systems integration and management.

A degree in mathematics, physics, engineering or chemistry is necessary for scientific work; two years experience with a degree for commercial programming with knowledge of COBOL and/or assembly language coding.

Please send your resume to Mr. Harvey Weisberg, Employment Manager.

**Vitro** LABORATORIES

14000 Georgia Avenue • Silver Spring, Maryland 20910  
(Suburb of Washington, D. C.)

An equal opportunity employer M&F

it can be seen that the bi-octal representation expresses any hexadecimal number based on the value of the coefficient  $d_i$ .

In order to implement the bi-octal system, the following scheme is suggested for representing a hexadecimal digit:

0, 1, 2, 3, 4, 5, 6, 7, 0,  $\bar{1}$ ,  $\bar{2}$ ,  $\bar{3}$ ,  $\bar{4}$ ,  $\bar{5}$ ,  $\bar{6}$ ,  $\bar{7}$  where the bar ( $\bar{\quad}$ ) denotes the value of the coefficient,  $d_i = 1$  and the absence of the bar denotes  $d_i = 0$ . The correlation between the presently used hexadecimal number representation and proposed bi-octal number representation is given in the following table:

Hexadecimal	Bi-octal
0	0
1	1
2	2
3	3
4	4
5	5
6	6
7	7
8	$\bar{0}$
9	$\bar{1}$
A	$\bar{2}$
B	$\bar{3}$
C	$\bar{4}$
D	$\bar{5}$
E	$\bar{6}$
F	$\bar{7}$

It should be remembered that place value in the bi-octal system is identical to that of the hexadecimal system. For example, the bi-octal symbol  $\bar{2}$  in the second place, as in the numeral " $\bar{20}$ ", indicates ten sets of sixteen or the number 160 when converted to decimal notation. The bi-octal numerals are considerably more convenient to use than the conventional hexadecimal notation with its six letter symbols. Certain rules have been established for the operations of addition, subtraction and multiplication, in the bi-octal system. These operations are described below. The methodology outlined is believed to offer a simpler means of performing these computations than does the hexadecimal system, particularly for those people who are not well versed in computer arithmetic.

The operation of addition is performed in the bio-octal system by adding, as in the decimal system, and expressing the sum modulo 8. The "carry value", if any, represents sets of sixteen, as in the hexadecimal system.

The following rules are estab-

lished for addition in the bi-octal system:

1. If the two digits that are to be added do not have the bar symbol and the resultant produces a value equal to or greater than eight, the resultant is the value of the remainder with a bar. (i.e.  $5 + 4 = \bar{1}$ )

2. If one of the two digits to be added has the bar symbol and the resultant produces a value less than eight, the resultant is the value of the two added digits with a bar. (i.e.,  $\bar{3} + 3 = \bar{6}$ )

3. If the two digits to be added both have bars and the resultant produces a value equal to or greater than eight, the resultant is the value of the remainder with a bar and a one carry for the next digit. (i.e.,  $\bar{6} + \bar{4} = \bar{12}$ )

The following conditions produce a one carry:

1. If one of the two digits to be added has the bar symbol and the resultant produces a value equal to or greater than eight, the resultant is the remainder with a one carry. (i.e.,  $\bar{6} + 4 = 12$ )

2. If the two digits to be added both have bars and the resultant produces a value less than eight, the resultant is the sum, Modulo 8, with a one carry. (i.e.,  $\bar{4} + \bar{3} = 17$ )

3. If the two digits to be added both have bars and the resultant produces a value equal to or greater than eight, the resultant is the sum, Modulo 8, with a bar and a one carry for the next digit. (i.e.,  $\bar{6} + \bar{4} = \bar{12}$ )

To multiply two digits in the bi-octal system, express the product Modulo 8. The carry value is determined by:

1. If the multiple of 8 is even, take one half of that number.

2. If the multiple of 8 is odd, take one half of one-less-than the multiple for the carry value.

If the number of Modulo 8's is odd, the resultant digit has a bar.

$$\begin{aligned}(5 \times 5) &= \bar{11} \\ (7 \times 7) &= 31\end{aligned}$$

3. If the two digits to be multiplied have bars, multiply the two digits modulo 8, and take half the number of mod 8's, as above, for the carry. If the number of mod 8's is odd, the resultant has a bar. Now, multiply the bar value of one digit by the number value of the other digit, taking half the resulting value as the carry. If the number is odd,

# Room at the Top

We're going to fill it with the best information system and programming professionals in the business. It's in our new 60-story building and there's plenty of room for the right men. But we don't have a spare inch for limited ideas. That's why our EDP program has never stopped growing. We hope it never does.

The men we want are that way, too. Men who keep growing. Men who want careers—not jobs.

You're ready for our room when you think 4th generation and can design solutions before there are

problems. You'll develop systems and software ahead of the hardware. And you can put your creativity to work in our massive terminal network and large scale IBM complex.

The men and women in our room will be expected to re-think accepted techniques. Then replace them with dynamic improvements.

Our boss knows about this ad. He's Dick Wood. Ask him about our crew. About our salaries. You'll like what he has to say. And if Dick likes what you have to say, we've got the room for you.

# executive routine

Herbert E. Martenson

It's curious how some managements react to the man in charge of a computer project. I have known cases of genuine fear develop on the part of executives and managers as they find the people who developed the computer program more knowledgeable about a system than they are. The change in dependency status can become a real problem since human emotions are involved. Capable computer men are often side tracked or "resigned" to keep them in line. Subsequently, new ideas emanating from the computer group are greeted with antagonism and suspicion.

As a computer pro, it's vital to keep your line associates informed of what you're doing and why. It takes time, it's often tedious to explain things over and over again but it's the only way to gain true acceptance in many organizations. The man who is a line manager of a horde of people doing simple things, finds little solace in the fact that HIS employees are to be displaced and that those people remaining will need retraining—including himself. The problem is how to motivate people to work themselves out of their job. This level of altruism is difficult to attain, if you will permit an understatement.

I recall one situation involving Accounts Receivable. The company was in trouble. Collections were

*Mr. Martenson, in 18 years of industry experience, has acquired a broad exposure to a variety of manufacturing, distribution, personnel and accounting situations. These experiences, coupled with an Industrial Engineering education, cover the spectrum of computer, administrative and managerial activities. He is presently associated with Martenson Associates, a software firm with offices in Crystal Beach, Florida, and Park Forest, Illinois.*

*He has served as Director of Computer Services for the Signode Corporation and held a similar position at the corporate level with Greyhound. He also served as systems consultant to the smaller subsidiaries of these companies. In addition, he has been associated with R. R. Donnelley and R.C.A. in managerial capacities doing systems work.*

*In the course of these activities, he has had first hand knowledge of the points raised in this article. He offers a view of the computer field as seen by a practitioner.*

slow. Unearned discounts were not detected when taken. Trial balances were a physical impossibility due to the paperwork volume. Mechanization was clearly an economic necessity. A rush systems design project was authorized. Programmable control methods were developed with the "cooperation" of the line supervisors. And then the squabbling began. One year later, the project was incomplete. Everyone was unhappy about the inordinate delay. The basic A/R problem was more critical than ever and despite many opportunities for meaningful progress, discussions were still going on regarding the adequacy of the approach to be used.

An imaginary story? No, it's true. It happened even though top man-

agement "wanted" a different result. The scapegoat was Data Processing. The culprit was top management (not middle management). The line managers acted as normal human beings within the limits of the authority vested in them. Dedication to (absent) goals was missing. Also missing was attention and education by upper management to overcome the fears of the line managers and the clerks involved. It probably was a toss-up where the most money was lost—in an old, inadequate A/R system or in the cost of spinning wheels to get a better one.

How can situations such as the foregoing be avoided? In some cases it's impossible, but the following guides can be of some help.

## The death of the ordinary engineer.

You remember him. He worked on a tiny part of a big project. And he never did find out what his contribution amounted to.

As far as we're concerned, he's gone the way of the brontosaurus.

We learned early. Back when we were small, each of our engineers had to get involved in everything. Design, development, manufacturing, marketing—everything. And being involved, they became committed. It's worked beautifully.

We make the best memory systems, stacks, planes, and printed circuits on the market. Plus a brand new Multi-Application Computer (MAC 16). In short, we're growing like a weed. So we need more engineers.

If you want to get involved, write to me—E. A. Gage—at 6201 E. Randolph Street, Los Angeles, California 90022. Better still, call collect. (213) 722-6810. Naturally, we're an equal opportunity employer.

**LOCKHEED ELECTRONICS COMPANY**  
LEC Data Products Division • Lockheed Aircraft Corporation

1. Get agreement on exactly what is to be accomplished first. Don't ever discuss a time-table until the objectives are set down in an unambiguous form. In the statement of the objective, outline auxiliary problems in need of resolution.
2. Don't accept edicts (unless you have a computer that responds to them). You can't win. If you are told to get something done by a deadline, be certain it's feasible before acceding to the demand. Often there are factors far beyond your control that are involved in making a time-table effective. Unless you have commitments from everyone involved to get their part done, you will be left holding the bag.
3. Use some form of periodic project control technique consistent with the scope of the project. Manual methods are OK for small jobs. Mechanized systems are available for use on larger projects. (Look into the system used by Bell & Howell, Skokie, Ill. It works and it's simple to use.)
4. Report in writing, but avoid pointing fingers or finding fault with others involved in the project. Be objective! Repeat yourself. People often forget the salient parts of a previous report.
5. Discuss the future schedule with those involved in executing it to be sure no previously unforeseen problems have developed. If a change in schedule is required, document the reasons and change the targets appropriately. Don't keep hoping for a miracle. Avoid surprises.

Despite the fact that computers are old hat to the EDP practitioners, the mystique surrounding them remains with lay people. Fear of the unknown and untried is a normal human reaction that must be expected of others. Myths and misconceptions are also pitfalls to be dealt with. Remember to build time into your project completion schedule for these types of things, and you will be better able to satisfy the EDP needs of your organization. ■

ANALYSTS ● PROGRAMMERS

# CAN YOU DESIGN OR PROGRAM —

- ... *data base* for over 300,000 parts?
- ... a system to fully load and schedule a *machine shop*?
- ... a complete *order entry system* on line to a 360/65?

OR

- ... mathematical and simulation models of VTOL aircraft?
- ... software in support of a real-time data acquisition and reduction system, airborne computers or a major retrieval system for technical data?
- ... a general purpose program for the optimization of analytical and data-defined functions?
- ... numerical procedures for the solution of complex engineering problems?

Is this the kind of cerebral involvement you want? (and can take in stride?) You'll have ample opportunity to prove it... working with our select group of stimulating, far-thinking people. They're people who are dedicated to producing the most advanced airborne and surfaceborne transportation systems... *and the computer systems to support them.*

We'll give you the tools. Our inventory includes UNIVAC 1108's and IBM 360's with graphics and teleprocessing.

So, if you're looking for growing room, we'd like to talk to you about some pretty exciting career dimensions. We have exceptional assignments at all levels of experience for: **Programmers and Analysts in both Commercial and Scientific fields.**

Send your resume in confidence, stating salary requirements, to Mr. Leo J. Shalvoy, Professional Employment—or—deposit your resume in our lock box at the Software Age Resume Center in Boston during the SJCC.

# Let's be ANALYTICAL

Your value is based on experience, education and job knowledge. Your earning power, professional achievement and future are based on finding the right outlet for these assets.

To this proposition we offer Blue Cross—Blue Shield, a vital dynamic company, constantly moving and growing. We have several top level ANALYST positions available as a result of our accelerated growth.

## LEAD ANALYST

Highly skilled individual with at least 2 years experience as a project analyst demonstrating outstanding ability as an analyst.

## PROJECT ANALYST

Well informed individuals with 3 years or more experience as a senior analyst.

## SENIOR ANALYST

Knowledgeable, self-starting individuals with a minimum of 2 years experience as a junior analyst.

We currently utilize the IBM 360 systems and the Honeywell 200 series systems. We're planning for Real-Times and Telecommunications using IBM and Honeywell third and fourth generation systems. The languages used are Cobol and Fortran.

If you put your ability and potential together with our rapid growth and opportunity . . . well—we owe it to each other to meet and discuss it further.

You will earn an EXCELLENT SALARY and receive a generous BENEFIT PLAN for you and your family.

## COMPUTERIZED CHESS

If your field is Computer Science and you have difficulty choosing a topic for a thesis why not try "Computerized Chess." It is a very interesting and challenging topic. The following letter from Mr. T. A. Marsland may give you the inspiration you need.

"Although it is nearly two months since I read your item about chess-playing computer programs in the Checkmate column of Software Age, it is only now that I have stirred myself to bring my own program to your attention. This basic program was begun in March 1968, as an extra activity during my post-doctoral year at the University of Washington, and has continued on a part-time basis since that time. The program is written in Burroughs Extended ALGOL for execution on a B-5500. Currently the system is implemented on a commercial timesharing computer operated by COMNET Inc. in Orange, New Jersey.

"The program is accessed through a standard teletypewriter (Model 33 or 35). A set of dynamic control options can be used to direct such information as board position, legal move list and debugging data to the terminal. At any position a static analysis is performed to select up to seven moves for more detailed examination; that list may be further pruned before submitting the remaining plausible moves to the look-ahead procedure.

"The enclosed game was played against another machine, at the University of California, Davis, in a telephone match, it was my program's first victory. The opposition had a simpler scoring function but were using 3 ply (1 full move) look-ahead. At that time the B-5500 program did not have the look-ahead feature implemented, but the static analysis was fairly detailed. When playing against itself, my basic scoring function plays at an average rate of 8 secs. (CPU) per move.

"I realize that this system is not of the caliber of the MIT program, however, I expect great improvements during the year. Meanwhile, I am interested in arranging matches against other programs and hope that you will be able to put me in contact with the authors of those programs that you have heard about."—T. A. Marsland

## COMPUTER VS. COMPUTER

Marsland's computer was a Burroughs B-5500 at Bell Telephone Laboratories in Holmdel, New Jersey. His opponent at the University of California used an IBM 7044.

As you see, white played an interesting opening and a very impressive end game. Both computers made blunders in the middle game. White missed a king-queen fork on the sixth move but found it on the 7th, and after winning his opponent's queen on the 8th used his own queen to clean up the board. After losing his queen, black behaved like a 10-year-old who knows he is losing and starts giving away pieces to end the game quicker.

The important thing, of course, is that computers are learning how to play chess and before long we may have chess masters with names such as IBM 360 mod 101, CDC 8600, SDS Sigma 10, RCA Spectra 90, etc.

	B-5500 (White)	IBM 7044 (Black)		B-5500 (White)	IBM 7044 (Black)
1	P-K4	P-Q4	17	P-K5	NxR
2	B-N5	B-Q2	18	PxPch	K-K1
3	N-QB3	P-Q5	19	RxN	PxP
4	BxB	QxB	20	PxP	N-Q4
5	N-Q5	Q-K3?	21	Q-B6ch	K-B2
6	Q-B3?	P-QB3	22	QxBP	NxB
7	N-QB7ch	K-Q2	23	NxN	P-QR3
8	NxQ	PxN?	24	P-KN3	P-R3
9	QxB	P-KN4	25	Q-B6	P-QR4
10	N-K2	P-B4	26	QxPch	K-N2

16	K-Q2	NxBP	32	Q-KB7	checkmate

Sensing instinctively the priority of need, he is quick to grasp when the times are in tune with ideas still in development. His ability to conceive and apply innovative techniques gives life to the computer systems and software that give Honeywell the competitive edge in America's fastest growing industry.

Keeping ahead of competition has led Honeywell to an unprecedented period of growth. Within a year, five new facilities have been added or started. To keep pace, the Technology Center in Waltham, Massachusetts, has been expanded by 50%. A complex of twenty computers has been added exclusively for research and development. New requirements have been created for Technical Specialists at all levels . . . with particular emphasis on the following areas:

#### SOFTWARE SPECIALISTS

- Advanced Data Management Concepts
- Interactive Operating System Design
- Advanced Communications Controller Design
- Computer Aided Instruction
- Advanced Compiler Design Technology
- Formal Language and Syntactic Analysis
- Computergraphics
- Modular Programming Theory
- Simulation and Modeling Techniques
- Information Structures
- Microprogramming
- Theory of Program Structures

Please forward your resume to Mr. Stephen Edmonds.

As the size of systems grows, the implementation time grows and is laden with revisions. As the complexity of the system grows, the processing algorithms frequently become analysis and research efforts. The system design then becomes highly fluid and dependent upon these R&D outcomes. Management and the working analysts need some unit of systems design effort that can be scheduled, designed, and documented for independent evaluation. The Software Module can be designed and documented in just this fashion. In this form, the module can be the means of coordinating the various programs at an installation into something like a cybernetic whole. This paper addresses the problem of module design in a systems design context, including documentation and the management problems of visible progress, political priority and education.

# Software Modulization

## Part I

*By Donald Ventner Mathusz*

### 1.0 Overview: The Ad Hoc Systems Design Syndrome

As long as one small group can do the analysis, design and programming in a short period of time, system environment shifts and their system revisions can be avoided and the implementation job remains relatively simple. In this situation documentation will probably be left to slack periods (almost never). Critical data and timing interfaces between packages, and programs will be left to the memory of a few key people. Unfortunately, as systems groups evolve, slack man-hours grow less and systems grow in size and complexity while manpower turnover increases.

As the size and complexity of software systems grow, the basic job of achieving full implementation grows beyond bounds. All manner of necessary and desired revisions are proposed to the pieces of the system implemented, in process and under study. The management of implementation becomes one of great effort merely just to keep the

present state of implementation updated revisionwise, while the total system implementation progress is diluted.

Under these circumstances, the management problem can easily become ensnared in such vast volumes of details, that the resource allocation of directed man-hours in analysis, design and programming becomes an almost impossible job. (This has been proven at a number of computer groups.) Some of the developments contributing to this problem are listed below:

(a) Changes in hardware, machine language, core size and arrangement that occur over long time periods.

(b) Documentation: non-existent, deficient, or non-standardized.

(c) Interface programs and/or information flows not explicitly documented.

(d) System shifts in time, i.e., changes in needs before the original system is complete such that major revisions occur before the initial project completion.

(e) Long-complex programs whose logic is highly interdependent,

therefore difficult to follow and more economic to rewrite than revise. (Program probably includes "trick" statements that only operate to the programmer's unique logic on particular compilers.)

(f) Lack of input data quality control, e.g., range of acceptable values, negative not allowed checks et al. not found in operation or documentation.

(g) Visible progress (lack of): for political reasons it is wise to be able to display progress and for project control purposes we need meaningful milestones to monitor.

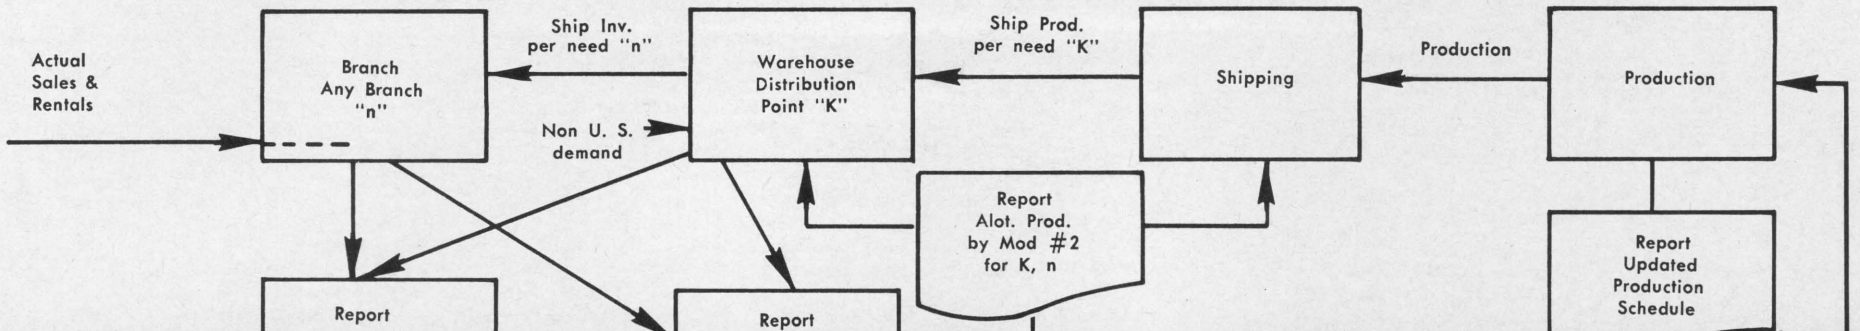

(h) Projects become increasingly complex and algorithms must be researched. The final system design is now dependent upon the results of these studies.

### 2.0 Management Control

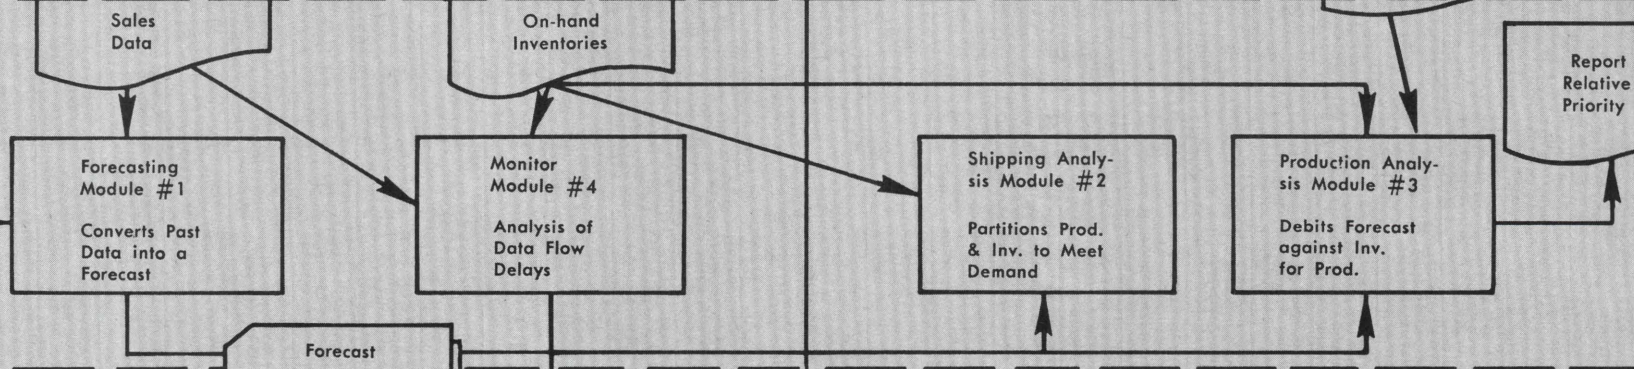

Management must concern itself with the problems of implementation progress, resource allocation to this end, and the political problems of funding, payoff rate, and priority of goals. This entails defining independent unit work packages and their resource and funding input re-

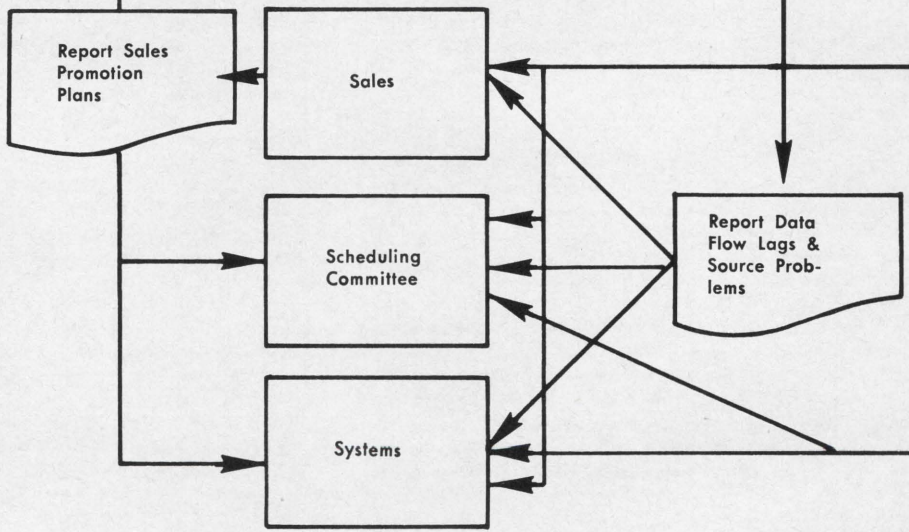

Zone 1—Physical Facility Entities

Zone 2—Data Processing Entities

Zone 3—Control Entities

(Boxes represent focal points of the system)

Figure 1

quirements and relating these to the goal achievements. The definition of the work package is the key to the problem of scheduling, costing and achievement measurement. It must be done such that it is, in fact, an independent entity that can be designed, programmed, and operated independently of other work in progress. This independent entity is defined as the software module. Its processing function(s) input and output I/O are defined at the system design stage in general. In particular, the I/O is defined rigorously such that its exact data needs and products are known for use in a multiprogramming team effort. In this manner, several programming teams can be working on different modules of the program efficiently.

Scheduling of the effort, using the modules as major milestones or PERT net nodes, becomes effective. To accomplish the system, there will appear some necessary prerequisite relationships between set of modules. But also, there will be some choice within module sets as to implementation order. The effects of smoothing resource expenditures will mean that the theoretical maximum effort/shortest time elapse path will not be taken. Rather the project will be lengthened such that man-hours and funding costs are reasonably uniform. The net effect of this upon choice among modules is to increase the number of independent choices greatly. As an example consider the case where three activities have only one common prerequisite event in the fundamental scheduling net, i.e., these three and basically parallel activities. If we have resources to do

*Donald V. Mathusz is currently an Operations Research Analyst with a Department of Navy Laboratory. His government experience has included work in reliability systems, threat analysis and logistics systems simulation. His current work involves directing cost-benefit analysis utilizing simulation as both a costing and benefit evaluation tool.*

*His industrial experience ranges from toolmaking through to the design and management of computerized sales forecasting and production control systems. He has taught statistics and computer systems courses and presently holds the BIE, 1960, from Syracuse University; MMgmtE, 1963, from Rensselaer Polytechnic Institute, and is now attending the University of Maryland.*

only one at a time, the effective schedule net (resource restrained) puts these three activities in series. But note that now the activity order is independent in the series of three and our independent choices increase from one to six. Paradoxically, choice increases as the scheduling net is resource restrained.

A few minor points remain. Debugging is an important part of the total effort. Just as subroutines ease this problem considerably in the domain of programming, their larger modularization units help at the sys-

tems level. Documentation which should be complete, standardized and act as an indexing device for revision and implementation, is usually a neglected item. Part of the blame rests with a lack of standardization which results in unnecessary documentation work for the writers and undue analysis time for the revision programmer. Modularization yields a ready-made documentation format that diminishes both problems while at the same time allowing documentation to progress in bits as the module is completed.

## We're doing exciting things in Pasadena.

There are more things happening in Pasadena than its annual Tournament of Roses Parade and Game. Exciting things are going on and Burroughs is in the thick of it. Our Pasadena location is the hub for the design and development of Burroughs commercial computer systems. Products such as the B500, B2500, B3500, B5500 and B6500 have all been designed and built in Pasadena. And...we've done this with a relatively small engineering and programming staff! This means that each member of our technical team has made significant individual contributions.

We are now in a tremendous growth situation but we do not intend to forsake the very thing that we've achieved...and that is product excellence (based on individual contributions).

So, here is what we offer...

- individual recognition.
- fantastic growth.
- non-defense industry.
- professional environment.

Current programming openings are in Software Development and Design Automation. We are looking for a variety of backgrounds to fill these positions. Primarily we are seeking degree types in such disciplines as Computer Science, Electrical Engineering, Mathematics and Physics who have from zero to five years experience. We will gladly consider other qualified candidates. Why not contact us now?

Send your resume to: Mel Olson, Burroughs Corporation  
460 Sierra Madre Villa, Pasadena, California 91109

## Burroughs Corporation

**Math Modelers  
Scientific Programmers...  
Do you measure up?**

If you are an **Electronic** and/or **Simulation Specialist**, you're invited to "measure" your talents against our needs. We'd like to tell you about our exciting new simulation programs in military aircraft & spacecraft, commercial jetliners and railroad trains.

To arrange an interview, call us at the Spring Joint Computer Conference at (617) 227-8125.

If you're unable to call, please send your resume, today, to:  
Mr. D. H. Besgrove, Professional Employment, Conductron Corporation,  
P. O. Box 426, St. Charles (near St. Louis), Mo. 63301.

**CONDUCTRON  
CORPORATION**

An equal opportunity  
employer

This should lessen the boredom of the last big write-up while eliminating the management temptation to put off the documentation effort because of new program demands.

### **2.1 Visible Progress, Political Priority and Education**

Whatever the choices are for a project's given implementation rate, we can use them effectively to accomplish two necessary political goals. In a sense, the first is defensive and I call it visible progress. It matters little to higher management what real progress is—if they can't see and evaluate it (barring an unusual total confidence). The uniform display of progress is a political necessity in a department's life. The visibility of progress is served well by the module concept in both presentation and the opportunities for partial implementation.

The order of priority of partial implementation is a potent weapon in visual progress and a second aspect: political priority and education. The political priority refers to the desires of key people as to what they want immediately from the system. By education, we here refer to the problem of teaching management what they can and cannot have from an information system. This is sometimes referred to as growing a system about the management in command and control systems.

The system output modules are very sensitive to this aspect, and little conflict should exist in and between political priority and educational priorities of implementation. Where it does exist, however, it becomes hypercritical and requires the finest diplomacy and management possible. Our purposes here, however, is not to examine this problem, but merely to pinpoint the place of modularization in it.

### **3.0 Modulization in Systems Designs**

While we are not basically concerned with systems design as such, in order to clarify modularization's place in it we are forced to outline some phases of it. This is especially so, since the literature tends to deal with either the highly theoretical or the specific case study. In general, we might say that the relationship of the module to systems design is analogous to the relationship of the subroutine to the program.

### 3.1 Outline of the Analysis-Design Cycle

Systems analysis typically precedes systems design since it is by definition a predesign process. Actually the systems analysis involves two separate analyses, or at least one would expect to assign different kinds of analysts to them. We would call the first endogenous analysis. It is concerned with the formal or informal information systems already in existence within the relevant organization. The other is exogenous analysis, and it is concerned with all relevant external information sources both specific and general, such as economic indexes.

It should be apparent that the system design interacts with the analysis to produce the final system. This interaction involves goal, economic and technical trade-offs. We prefer to begin the systems design as an independent activity by designing an "ideal" cybernetic system. The project schedule is then tentatively drawn up to verify, find or generate the need design parts.

A critical element in this process is in what manner the vast volumes of detail will be organized. The module serves as the vehicle for organizing this detail into parts that can be evaluated independently.

### 3.2 The Ideal Cybernetic System Design

The system design may be thought of as a structure comprised of inter-module flows and the functional modules in three classes—physical information, processing and control. The system net may be drawn in a variety of ways, but the net flow using nodes as processing functions and flows as internode directed lines is compact and describes all the needed static relations. A basic cybernetic design for the typical inventory problem of the manufacturing concern is shown in *Figure 1*. It should be kept in mind that this design was made only detailed enough to display and isolate the various kinds of systems design problems. Remember too, that the complex problem of phasing a new system design into an existing prior system will not show here, but on the implementation schedule net. So we have not presented the entire story, but only enough to show the basic place of the software module.

*(to be continued next month)*

## ADVANCEMENT MINDED?

The Metropolitan New York area offers outstanding opportunities in the field of Data Processing.

### WELLS RECRUITING SYSTEMS, INC.

one of the nation's leading EDP groups, is now placing qualified Programmers and Analysts in exceptionally rewarding positions with over 1500 client firms in such industries as Petrochemical, Financial, Transportation, Manufacturing, and Consulting.

Applications include:

## HEXIDECIMALS (Continued from page 11)

the first digit is 0. Repeat this step multiplying the bar of the other digit by the digit value. The bar multiplied by the bar produces a carry of 4.

$$\begin{array}{r} \bar{7} \\ \bar{6} \\ \hline 2\bar{2} \\ 30 \\ 3\bar{0} \\ 40 \\ \hline \bar{5}2 \end{array}$$

4. If one of the two digits to be multiplied has a bar, multiply the two digits modulo 8. Determine the carry number by the prescribed method. If the number of mod 8's is odd, the resultant has a bar. Now multiply the bar value of the bar-digit by the number value of the other digit, taking half the resulting value as the carry. If the number is odd, the carry value is half of one-less-than the number and the first digit is 0.

$$\begin{array}{r} \bar{7} \\ 5 \\ \hline 23 \\ 2\bar{0} \\ \hline 4\bar{3} \end{array}$$

The bi-octal subtraction method involves the use of subtracting two digits as in decimal whenever the minuend is larger than the subtrahend. If the subtrahend is larger than the minuend, a borrow of one from the preceding digit of the minuend is taken and the two digits are subtracted as in decimal, with the resultant digit producing a value minus two. The resultant digit will have a bar symbol under the following conditions.

1. If the two digits that are to be subtracted do not have the bar symbol, the resultant digit will have a bar value.

$$\begin{array}{r} 34 \\ -5 \\ \hline 2\bar{9} - 2 = 2\bar{7} \end{array}$$

2. If the subtrahend digit has a bar and the minuend does not, the resultant digit will not have a bar value.

$$\begin{array}{r} 23 \\ -\bar{6} \\ \hline 17 - 2 = 15 \end{array}$$

3. If the two digits that are to be subtracted both have a bar symbol, the resultant digit will have a bar value.

$$\begin{array}{r} \sqrt{52} \\ -7 \\ \hline 45 - 2 = 43 \end{array}$$

The addition and multiplication table on page 27 shows the consistency and simplicity of the above rules governing bi-octal representation and arithmetic operation.

The division scheme of bi-octal numbers involves taking the divisor into the dividend. As in decimal division, bi-octal division will employ a rigorous trial and error procedure to obtain the proper quotient.

$$\begin{array}{r} 13 \ 3\sqrt{3} \\ \overline{3\sqrt{54}} \\ \underline{3} \\ 24 \\ \underline{21} \\ 3 \end{array}$$

The bi-octal number may be converted to decimal integers by repetitive division of the value 2 into the quotient. The remainders make up the decimal value.

$$\begin{array}{l} \overline{2} / \overline{234} \\ \overline{2} / \overline{106} \quad 0 \text{ Ans. } 2620_{10} \\ \overline{2} / \overline{12} \quad 2 \\ \quad \quad 2 \quad 6 \end{array}$$

(Continued on page 27)

**COMPUTER PROFESSIONALS:**

**"HOWARD LEVIN IS PROBABLY THE WORLD'S BEST QUALIFIED\* EDP EMPLOYMENT AGENT"**

\*MBA, Personnel management; 5 years industrial personnel experience for a major electronics and computer firm; 5 years hands-on computer programming and systems analysis experience; Director and placement counsellor for RSVP SERVICES since 1966.

His personal services are free and convenient. Why settle for less?

# EDP PROFESSIONALS

A major insurance company in New England has created career opportunities at its Corporate Headquarters. These positions offer an excellent future, along with good salaries based on experience and background, as well as top benefit program including company paid relocation expenses.

## SYSTEMS ANALYST

Telecommunications

At least 2 years telecommunications systems experience. Applicant will probably have been chief analyst or 2nd or 3rd man in designing systems, network designs, hardware and software selection and involved with total system communications. Will analyze and select available software, develop special software specifications, develop special error recovery processes and procedures, and work with telecommunications terminals, as well as work closely with applications analysts designing communications based systems.

## HARDWARE ANALYST

College grad or equivalent with several years EDP experience. Must have participated in the analysis and selection of medium/large computing system, and have developed practical method of measuring utilization of data processing equipment. Will study all phases of computer characteristics, and become familiar with vendor's uses of equipment, develop computer usage prediction methods and review new systems program hardware.

## SYSTEMS PROGRAMMER

Application Support

Minimum 2 years experience in third generation systems and programming on IBM s/360, Model 50 or 65. Must have working knowledge in the following areas: (1) BAL (2) MFT II or MVT (3) DASD-2314, 2321. COBOL experience helpful. Must also be capable of providing technical assistance to application areas in the systems design, programming and de-bugging phase of a project.

## SYSTEMS PROGRAMMER

Operating Systems

Minimum 2 years experience in third generation systems and programming on IBM s/360, Model 50 or 65. Must have working knowledge in the following areas: (1) BAL (2) Generating, maintaining and refining operating systems MVT or MFT II (3) DASD-2314, 2301, 2303.

## PROGRAMMER ANALYSTS/SYSTEMS ANALYSTS

Fire and Casualty/Life

Requirements: 3-5 years experience in design and implementation of major systems in fire and casualty or life applications. s/360 experience desirable. To assist in development and implementation of any of the following areas:

• Fire and casualty policy issue or claim systems using terminals • Life/health policy issue systems using terminals • ALIS system • Consolidated system of group life/health processing using terminals.

Hardware available includes 360 models 65, 50, 30 and 20—OS, DOS, 2311's, 2314's, 2321's—MVT, MFT, 2740 model 2's. Excellent opportunity to advance into new project responsibilities including supervision of staff of programmers.

## PROGRAMMERS

Fire and Casualty/Life

College grads preferred, but equivalent experience acceptable. Requires 2-3 years programming background. Knowledge 360 COBOL desirable. Insurance experience desirable but not essential. Duties involve research, defining, writing and de-bugging programs and supervising junior programmers. Excellent opportunities for advancement.

## BOSTON INTERVIEWS

Drop your resume into our Lock Box during the meeting, May 14-16, and our representative will contact you immediately upon receipt.

Or send your resume and salary requirements in confidence to Director of Recruiting

Programmers and systems analysts...

## Univac: Where you can help make the world a little bit better

An American astronaut hasn't walked on the surface of the moon... yet.

But now America's manned Apollo 8 space shot, with the help of UNIVAC® computers, has successfully orbited the moon. Which brings an American lunar landing that much closer to a reality.

The people who are proudest of this Apollo flight aren't just NASA people. They are also the Univac programmers and systems analysts who spent months writing the programs that made the use of telemetering of this flight possible.

You see, we understand that nothing bothers a programmer or systems analyst more than doing busy work. So we keep our people busy with meaningful work like the Apollo program.

What's more, we feel that the important problem is a problem that still hasn't been solved: the problem of keeping America strong. Because when America is strong she can better fulfill her obligations to underprivileged countries looking to her for help and direction. This is where you come in.

Univac needs people who are old-fashioned enough to care about making the world a little better. Who are interested in making a real contribution, not just marking time. And who want to be rewarded on the basis of the excellence of their service, instead of just on the length of their service.

If you're this kind of person, we here at Univac can't offer you a job. But we can offer you a fine career. Think it over and then check the facing page for a complete list of current Univac job opportunities.

 SPERRY RAND

# TROUBLE-TRAN PRESENTS XTRAN'S ADVENTURES IN FORTRAN

By GEORGE N. VASSILAKIS

Send your ANSWER to the problems posed here in each issue to:

TROUBLE-TRAN EDITOR

## software age

P. O. Box 2076

2211 Fordem Ave., Madison, Wis. 53701

You can also profit by submitting PROBLEMS for this feature. If your problem is FORTRAN programming is selected for use in this feature, you will receive ----- \$25.00

### TROUBLE-TRAN's Objectives:

1. To have fun.
2. To promote USA Standard FORTRAN by pointing out differences and inconsistencies of existing FORTRAN Compilers.
3. To alert programmers to the physical limitations of hardware.

### Contest Rules:

1. The best answer (best explanation) bearing the earliest postmark wins -- \$25.00
2. The second best answer with the earliest postmark will net the reader submitting it ----- \$15.00

# PROBLEM OF THE MONTH

Here is a program that will compile without any difficulty; but will it execute?

C SUBMITTED BY LEON ZAR

```

K=0
GO TO 400
200 GO TO (101,102,101,102,101),K
101 WRITE (6,10)
STOP
101 WRITE (6,9)
STOP
400 IF(K)402,401,401
401 K=-5
GO TO 200
402 WRITE (6,8)
STOP
10 FORMAT (14H GO TO IS OKAY)
9 FORMAT (18H GO TO IS NOT OKAY)
8 FORMAT (17H GO TO HAS FAILED)
END
    
```

Which FORMAT message, if any, will be printed?

# ANSWER TO LAST MONTH'S PROBLEM

The problem was stated as follows:

```

X=1.0          SUBROUTINE SUB1(X)      SUBROUTINE SUB2
CALL SUB1(X)   COMMON X              COMMON X
STOP          CALL SUB2              WRITE(6,1)X
END          RETURN                  1 FORMAT(3H1X=E15.8)
          END                        RETURN
          END                        END
    
```

Will it compile? Will it execute? What will it print for X?

The solution, of course, depends on what the compiler would do with X in subroutine SUB1. The appearance of X as a dummy argument and also as a variable in COMMON storage is not allowed. However, not all compilers are sophisticated enough to detect this illegal use.

If the subroutine compiles, changes are the compiler will treat the two uses of X as two different variables, and when SUB1 is called all subsequent appearances of X will be using the value of the dummy argument X. The only exception is the X in COMMON which will be assigned a different cell and nothing will be placed in this cell at execution time. The value of X that will be printed by subroutine SUB2 depends on whether or not the loader sets core to zero at load time.

The level H FORTRAN Compiler on the IBM OS/360 did not allow SUB1 to compile. The same program compiled and executed on the IBM 7094, and printed a -0.00 as the value of X. The CDC-6600 FORTRAN will also allow this to compile and execute with different cells assigned to the two different appearances of X in SUB1. If you are a CDC user, this problem may not exist on your machine by the time you read this column, since this item is already included in the CDC FORTRAN laundry list.

P. S. Several readers have written to tell me that I was wrong in stating that the problem in the February issue did not violate any FORTRAN standards. My attention was called to section 8.4.2 of the USA Standard FORTRAN. One paragraph in this section reads:

"If a subroutine reference causes a dummy argument in the referenced subroutine to become associated with another dummy argument in the same subroutine or with an entity in common, a definition of either entity within the subroutine is prohibited."

Even though I must admit I was wrong and offer my apologies, it gives me a great pleasure to see that some readers are treating my column as a core dump which needs debugging.

My mail indicates that the percentage of programmers who pay attention to the USA Standard FORTRAN is very small (under 10%). Is there anything we can do to help? Please send your suggestions to this editor.

Thank you  
XTRAN

### TROUBLE-TRAN WINNERS

\$25.00 first prize for the February problem: Mr. D. J. Frailey, 329 Pearl Street, West Lafayette, Indiana 47906.

\$15.00 second prize for the February problem: Mr. J. P. Mashey, 119 Locust Lane C-7, State College, Pennsylvania 16801.

# Programmers and Systems Analysts:

## Come to IBM and help solve tomorrow's programming problems.

Many people talk about tomorrow. At IBM's Federal Systems Division, we work on it.

We need creative programmers that think ahead of the state-of-the-art. Our present projects are geared to help solve problems in the 1970's.

### Wide range of projects.

Right now we're researching missile systems to cover the needs of the next decade. We're out to help monitor air traffic while en route. Retrieving delicate seismological data. And becoming even more involved in America's space program.

In this work, of course, we use the latest computers and peripheral equipment. Much of the work is in real-time... involving multiple-access concepts.

### What you'd do.

We need programmers and analysts with experience in one of two basic areas: information-handling systems or scientific engineering programming. You should have a Bachelor's degree in Mathematics, Physics, Engineering, Economics, or Statistics with at least one year's experience.

### Can you solve problems?

Today's major growth industry is information handling and control. And IBM is a leader in that field. This growth environment can bring out the best of your talents and abilities. Because in a growth company like IBM you must work constantly toward greater achievement. This means more opportunities to achieve distinction and personal recognition.

So if you're a problem-solver who wants a personal sense of achievement and recognition for your hard work in an exciting growth company, consider IBM.

### Call or write.

Learn more about the opportunities for you at IBM. Immediate openings exist in the Northern New Jersey area; and in metropolitan Washington, D.C. Call Jim Dunn at (301) 921-7724 collect. Or send a brief letter or resume to him at IBM Corporation, Federal Systems Division Headquarters, Dept. CD1012, 18100 Frederick Pike, Gaithersburg, Maryland 20760.

An Equal Opportunity Employer

# IBM<sup>®</sup>

IBM works with NASA's Goddard Space Flight Center to help control and maneuver satellites like ATS (Applications Technology Satellite).

IBM is helping air traffic controllers by computerizing their information input and display systems.

# The imaginative computer.

There's no such animal... yet. There are, however, imaginative computer programmers. And Lockheed in Sunnyvale is looking for these people.

To lure programmers, Lockheed promises not to cage them in one specific area of programming. Programmers

may choose to specialize in one area (reentry problems, for example) or they can move from one area to another—scientific areas as varied as astrodynamics, automatic checkout and graphic systems; and administrative areas as diverse as business applications and government information systems.

Lockheed offers the widest range of computer assignments in the country today so programmers will always find a field to stimulate their imaginations.

As a further incentive to programmers, Lockheed's 25-million-dollar computation center includes the most up-to-date digital computers and two of the most sophisticated and powerful hybrid computer systems in the country.

Imaginative computer programming has been, and will continue to be, instrumental in many of Lockheed's aerospace successes.

Delivery of the first Polaris missile two years ahead of schedule

was due in a large part to the Program Evaluation and Review Technique (PERT) developed by Lockheed programmers in conjunction with the Navy. Now Lockheed programmers are developing configuration data management systems for on-line, real-time computer analysis of manufacturing, financial, and personnel related data.

If you are a computer programmer, whose imagination is trapped by the same programs day after day after day... FREE IT! Send your resume, as soon as possible, to Mr. J. N. Love, Professional Placement Manager, Post Office Box 504, Sunnyvale, California 94088. Lockheed is an equal opportunity employer.

**LOCKHEED**  
MISSILES & SPACE COMPANY  
A GROUP DIVISION OF LOCKHEED AIRCRAFT CORPORATION

## There's a side to EDP you never saw before.

Xerox Square at Night

Some companies don't seem to know quite what to do about the EDP revolution. They don't want to miss out, so they set up some equipment, hire some programmers, and then give them tedious little chores.

The other side? EDP involvement at the fundamental level.

Marketing simulation models invited and *used*. Management decisions made *after* consultation with EDP. And a level of systems integration that *depends* on EDP assistance.

We'll give you some examples. Our programmers are developing an on-line inquiry system for Accounts Receivable including special equipment for transmitting and viewing data. Another group's project is devising a flexible format for individualized, localized reports.

In every department—from accounting, to marketing to engineering—you get in at the planning stages. You set your own goals as you help direct the company's.

We need more programmer/analysts and systems analysts who can do this, then move on. To senior EDP, functional specialties, and management positions.

A college degree and/or experience with IBM 360 series systems using COBOL, the Univac 1108 using FORTRAN or COBOL, or IBM 7000 series using COBOL or AUTOCODER is desired.

If you are interested and you think you'd like our way of doing things, we have openings in Rochester. Send your resume to M. Hartigan, Dept. MZ-69-D1, Xerox Corporation, P.O. Box 1995, Rochester, New York 14603. After all. Which side are you on? An Equal Opportunity Employer (M/F)

## AN ATMOSPHERE CHARGED WITH MENTAL KINETICS

The excitement of discovery is inevitable within the framework of interdisciplinary research at Booz•Allen Applied Research Inc. The shared insight of over 500 scientists and engineers is the key to our approach to problem solving. Over 30 distinct specialties combine forces to solve problems in government and military science of a decidedly non-routine nature.

Our assignments range from value engineering to astronautics. Our methods are today's most sophisticated. Few industrial or academic settings can provide this pace, change and opportunity for professional growth.

You may be interested in joining our international organization now or perhaps merely opening lines of communication for future decision. The complete Booz•Allen Applied Research story is available on confidential request. Write Mr. Ken M. Christians, Director of Professional Appointments.

**Boston's historic State House dominates Beacon Hill.**

**The traveller's view—of Boston Harbor.**

Tower, War Memorial Auditorium, and the Sheraton-Boston, is the site of the meetings themselves.

To the east, along Boylston Street, are the historic Public Gardens, noted for their swan boats, and the Boston Common. Just south is Park Square and the Stat-

ler-Hilton, location of the SOFTWARE AGE RESUME CENTER.

To the north of the Common is Beacon Hill and Louisburg Square, a picturesque and historic area of Old Boston. Government Center—a complex of buildings, plazas and pedestrian malls which has revital-

ized the downtown core of Boston, is located just east of Beacon Hill.

Of more specific interest to the computer professional are the numerous colleges and universities located near Boston, the N.A.S.A. complex near M.I.T., and Highway 128, Boston's "industrial road." Technical tours will be conducted by the convention organizers to these areas.

## Technology in Boston

**The students' view of Boston across the Charles River in Cambridge.**

---

Scientific Data Systems has successfully combined dynamic management principles, perceptive evaluation of industry's needs and a highly competent staff of professionals to become a recognized leader in the manufacturing of computers and peripheral equipment and software development. If you have the qualifications to contribute to our continued growth and seek an environment where you will advance to your maximum capacity, we have immediate openings in our new El Segundo, Calif., facilities for:

---

The logo for Scientific Data Systems (SDS) consists of the letters 'S', 'D', and 'S' in a bold, sans-serif font. Each letter is contained within a rectangular frame that is slightly offset from the others, creating a layered effect.

### **Application Software Product Managers**

Will be responsible for definition of software packages and project responsibility for their implementation including monitoring of external or internal development. Requires 6-10 years' programming experience in one of the following: simulation languages (GPSS), general business data processing, information retrieval, automatic numerical machine control and language processors.

### **Computer Applications Analysts**

Positions require customer liaison, supervision of software system installation, assisting customers in preparing special programs. Some travel required. Applicants must be familiar with all standard software packages. BS degree in math, engineering, or science preferred. Minimum of 2 years' experience required.

### **Design Automation Programmers**

Will be responsible for the system design and program development of an advanced design automation system. Applicants should have at least 2 years' programming experience and some digital electronics engineering experience. Technical degree required.

### **Diagnostic Programmers**

Individuals with programming and digital hardware experience are needed to develop diagnostic programs for advanced computing systems. Must have hardware, software, and systems experience and exhibit ability to isolate computer problems quickly and accurately. Must have experience related to: processor, memory, or peripheral diagnostic programming.

### **Language Processor Specialists**

Requires a minimum of 4 years' programming experience in one or more of the following: assembly languages, COBOL, FORTRAN, PL-1, SL-1, time-sharing, and/or real-time software systems.

### **Operating Systems Specialists**

Positions available in development or market support. Requires a minimum of 4 years' experience in medium- to large-scale monitor systems, including a knowledge of loaders, I/O queuing, interrupt processing, and processor interfacing, and machine language programming in macro or meta assemblers. Experience in time-sharing also desirable.

### **Programming Instructors**

To teach state-of-the art software. This is an opportunity for the experienced systems programmer to broaden his knowledge and learn the latest in time-sharing, assemblers, compilers, and monitors for third generation systems. Students consist of company and customer programming personnel.

### **Programming Writer**

A programming publications specialist is needed to prepare hardware/software reference and operation manuals and a variety of software related documentation. Position offers variety and challenge and requires knowledge of standard softwares, 3 years' college, and exceptional writing skills.

Send resume to Mr. Carl Kundman

# The computer industry is going time-sharing, and the world leader has the hot jobs

## Don't miss this one

WRITE:

W. J. Regan  
Information Service Department  
General Electric Company  
7735 Old Georgetown Road  
Bethesda, Maryland 20014

### **CUSTOMER APPLICATION SPECIALISTS**

to assist time-sharing users with the specific software problems and to develop new time-sharing applications. A chance for you to get into one of today's booming businesses and help make it grow. Openings exist at 25 District Sales Offices from coast to coast, so choose where you want to live and grow. Your background should include a college degree (BS or BA) plus programming experience in BASIC, FORTRAN, machine, or assembly language on a large computer. Systems knowledge is also desired.

### **SYSTEMS ENGINEERS**

for assignments in time-sharing systems engineering, terminal integration, communications and networking analysis. Background should include MS plus ten years' experience (or equivalent), with

at least five years with a major computer-based information system. Specialized knowledge is required in terminal development, human factors engineering, data communications, central computer system engineering, system interface development, cost effectiveness and reliability analysis, or operations research.

### **DIGITAL EQUIPMENT AND COMMUNICATIONS ENGINEERS**

for assignments in time-sharing system engineering covering computer and communication equipment terminals. Background should include applicable experience in computer systems or related equipment.

### **SYSTEMS ANALYSTS**

for creative, analytical assignments in programs and operating systems. Meet customer needs with long-range ideas. Prepare logical flow diagrams,

instructions, and test data to verify programs. Get to the root of businesses' planning problems. You need a minimum of two to three years' experience in programming or software systems design, practical experience in real-time and monitoring systems, plus a BS in math, engineering, computer sciences, or the equivalent.

### **PROGRAMMERS**

a strong interest in assembly language, FORTRAN, and real-time programming is desired. Considerable latitude is yours to develop programs for new time-sharing systems for all phases of business, industrial, and educational applications. Develop programs from defined concepts and specifications. Positions require a creative bent and one to four years' experience in time-sharing or other computer system programming.

World's Largest Financial & EDP Personnel Specialists.

# Programmers for ORBIT

ORBIT is one of the world's largest on-line, real-time teleprocessing systems linking H.F.C.'s national branch offices to the home office in Chicago.

WE CURRENTLY HAVE SEVERAL PROGRAMMING POSITIONS AVAILABLE ON THE FOLLOWING EQUIPMENT:

### 1401 and 1410 Autocoder

You will be deeply involved with accounting and financial procedures working with our existing programs in an operations environment. We would prefer you have 3 years experience in programming including 1 year of tape and/or disc work. You should also have Autocoder experience with IOCS language.

### 360 BAL

ORBIT is new, our system and concepts are new, even the applications are new. You will be working with the IBM Dual 360 Model 50 System. The successful candidates should have 2 years experience with a DOS background and a knowledge of BAL language.

A financial or Insurance application background as well as exposure to medium or large scale systems is preferred for both positions.

The challenge is great and of course, so are the rewards. We are offering excellent salaries and a comprehensive benefit plan.

Please call Mr. Cope

944-7174 (Area Code 312)

HOUSEHOLD FINANCE CORP.

Prudential Building, 33rd floor, Chicago, Illinois 60610

## EXPLORE CAREER OPPORTUNITIES WITH

# TRW HOUSTON

Work in a stimulating professional atmosphere where you can take part in some of today's most significant technological challenges. Houston is surrounded by natural playgrounds and recreational areas, and is blessed with a year-round temperate climate.

Scientific and Data Management Applications Programmer/Analyst. Experience in programming FORTRAN and/or COBOL with specialization in the areas of thermodynamics, environmental control systems, propulsion systems, electrical and electronics systems, analytical trajectory simulation, statistical analysis, data reduction, orbit determination, guidance simulation, integrating trajectory simulation, data management, data correlation, or information retrieval. BS, MS in Math, Computer Science, Physics, Engineering or other related disciplines.

Send resume to D. E. Paulson, Employment Manager, Room P6101-D, TRW Systems Group, Space Park Drive, Houston, Texas 77058. TRW is an equal opportunity employer.

# TRW®

TRW Systems Group is a major operating unit of TRW INC. where more than 80,000 people at over 300 locations around the world are applying advanced technology to electronics, space, defense, automotive, aircraft, and selected commercial and industrial markets.

# At the Spring Joint Computer Conference ...See EAI

We're world leaders in analog computers and a major factor in scientific and other Hybrid and Digital systems. More directly important to you, we're the kind of amply large but non-giant organization where ideas find a happy home and flourish. Our growth record and many "firsts" will underscore the idea.

We're located close by the Jersey beaches, in open country with genuine fresh air, no

crowding, few problems, moderate living costs.

Stop by and talk. We'd like you to be abreast of new EAI products, services, and developments. Since we're an active company where ideas find ready nurture, these openings tend to be interesting. Our people will be on hand to give information and answer questions.

## DIGITAL DESIGN ENGINEERS

We have some absorbing assignments if you have experience and special interest in one or more of these disciplines:

- Arithmetic Design • Algorithm Investigations • Main Frame Architecture • Memory Design
- Read Only Memory Techniques
- Mass Storage, CRT • Magnetic Tape, Disc

### High Speed Techniques

- Current Driver • Sense Amplifier • Input-Output Peripheral
- Circuit Design using MECL, T<sup>2</sup>L, DTL, RTL, Discreet • Digital Logic
- Packaging • Diagnostic Programming

### Communications

- Data Modems • Teletype Writer
- Data Multi-Plexers

## COMPUTER SALES ENGINEERS

If you have experience in the sale of computers, peripheral devices, data communication terminals, or industrial scientific instrumentation, we want to talk with you. We have new opportunities in our sales offices throughout the country.

To assist the Sales Engineer in his growth and development EAI provides formal applications, product, and sales training to augment basic technical and sales skills. And a lot more goes with the job—an attractive compensation package, excellent benefits program, extensive technical support plus a vigorous marketing organization.

## DIGITAL MARKETING SPECIALISTS

We are interested in the shirt sleeve professional who is anxious to get on his way to business planning and management. If you have a technical background in digital computer systems, here's where you can make it count.

These positions involve technical sales support, technical coordination of proposals as they apply to digital and hybrid systems, the generation of standard product literature for use in proposals, systems programming, and competitive analysis. Attractive compensation, excellent potential.

**What's the  
DATA TEAM  
doing at Collins?**

**Working with Collins' new C-System,  
the first completely integrated system  
with virtually unlimited expansion capability.**

The C-System is creating exceptional career opportunities for: Programmers, Hardware Diagnostic Programmers, Circuit Design Engineers, Memory Design Engineers, Digital Systems Engineers, Digital Systems Analysts, Logic Design Engineers, Mechanical Engineers, Data Systems Analysts and Applied-Systems Analysts/Programmers.

In addition, other individuals with up to 3 years experience and a degree in electrical or mechanical engineering, physics, mathematics, or other physical sciences will find an outstanding opportunity to learn and progress rapidly in the data field, even without previous data experience.

Collins data systems are used by airlines and railroads to process and transmit hundreds of thousands of messages a day. They provide computer control of earth stations for satellite communications, permit digital control of communication/navigation systems in airliners and

military aircraft, and combine communication, computation and control functions in single systems for large business and military operations.

If you are interested in joining the Collins data team – and benefiting from the creative environment and career opportunities offered by Collins – send your resume in confidence to Manager of Professional Employment, Dept. 102, Collins Radio Company, Dallas, Texas 75207; Cedar Rapids, Iowa 52406, or Newport Beach, California 92663.

*an equal opportunity employer*

## Westinghouse Information Systems Laboratory

As the corporate center responsible for developing and applying information technology, WISL uniquely blends the total capability of the Westinghouse corporation with the extensive, highly specialized know-how of its own staff. This uncommon mix of uncommon capabilities has significantly contributed to the development of superior systems and to innovative solutions to customer problems.

### WISL is structured into two operating departments:

#### M.I.S.D.

##### Manufacturing Information Services Department

Provides a unique, highly specialized, new information service to industry in the field of numerical control and computer aided problem solving.

#### I.C.S.D.

##### Information & Control Systems Department

Supplies a wide range of problem solving services to all of the markets served by Westinghouse.

### Accelerated expansion program has created these immediate management and professional opportunities:

**NUMERICAL CONTROL** Advanced Languages • Large Program Organization • Modeling Techniques • N/C Programming • N/C Post Process or Design • N/C Manufacturing Technology.

**TIME-SHARING** Software Design • Software Programming • Applications Design • Applications Programming • System Evaluation • System Operation.

**COMPUTER-AIDED DESIGN** Design Information Systems • Statistical Analysis • Engineering Analysis • Structural Analysis • Project Management • Circuit Analysis • Thermal Analysis • Program Debugging and Testing.

**MANUFACTURING SERVICES** Should have experience in manufacturing engineering, marketing, parts programming, computer language and developments, planning and engineering processes.

**PROCESS CONTROL** (1) Engineers experienced in modeling of physical systems (2) people experienced in analog, digital and highbred simulation (3) on-line control computer programmers with software and hardware field implementation experience.

**DISCRETE MANUFACTURING PROCESS CONTROL** Individuals capable of applying process control computer know-how to on-line computer control of production, testing, product quality, machine tools, and materials handling equipment.

**MANAGEMENT INFORMATION SYSTEMS** Personnel experienced in system analysis, system design and implementation and real time systems.

**PRODUCT PLANNING** Experienced professional in marketing economic evaluations of industrial application requirements and proprietary software developments. Knowledge of manufacturing, fabrication, electronics and construction industry.

### SALES

**MARKETING REPRESENTATIVE/CONSULTANT** Experienced in sales of intangibles at executive level; application of computer technology to solving management problems in industry, municipal government, institutions, etc.

**SALES MANAGERS & SALESMEN** Experienced in time-sharing . . . N/C programming systems . . . N/C machine tool sales . . . computer-based services . . . or computer hardware/software sales.

Westinghouse Information Systems Laboratory is located in beautiful suburban Pittsburgh, "The Renaissance City," offering lovely residential areas, excellent schools, shopping centers, cultural and recreational facilities. Many of the positions, particularly in marketing, will be located in major municipalities throughout the U.S. We offer attractive salaries and excellent benefit programs.

Send confidential resume to:  
W. J. YOUNG, Supervisor Personnel Services.

# Computers In the

by Charles H. McCoach

This paper will discuss three distinct subjects that will reflect the use of computers in secondary education. The first will cover what is currently being done nationwide, the second will be a reflection of what we feel should be done and the third will discuss what we are doing in Barry County, Missouri.

When we look at computer education nationwide it becomes immediately obvious that more could be said about what is not being done than what is being done. A survey conducted by the University of Denver during the winter of 1967 reveals the number of schools involved in com-

puter work. The results of this survey is given in Table 1. Even a cursory study of this table gives us a stark picture of the neglect of this increasingly important subject. Briefly the use of computers in high schools will fall into one of the following categories:

1. Computer Aided Instruction (CAI)
2. Administration of the School
3. A tool to be used in conjunction with another course
4. As a unique subject in itself. Uses, languages, etc.

Of the four applications we feel that only the last two are legitimate courses that could be called computer science. The third application

# Classroom

McCoach has had extensive experience in secondary education, both as an instructor and administrator. He was formerly with the Boeing Company in their Systems Administration and Computing Department.

usually involves teaching an advanced mathematics science, or business course while the subject of the computer remains incidental and collateral to the main topic. This approach has merits, but it also has a number of liabilities not the least of which is the severe limitation on the number of students that become involved, and the depth of the study of the computer.

It is not the purpose of this paper to discuss the reasons for the neglect of this subject, but the reader might be interested to know the most frequently expressed. They are:

1. Hardware availability

2. Costs

3. Instructional personnel

4. Can secondary students learn the material?

While each of these, on the surface, appears to have a basis in fact, our investigations have revealed that they are not difficult to overcome.

What *should* be done about computer education in secondary schools? Having had experience in both education and industrial scientific

A major consideration in establishing a Computer Science course is the ability for students to prepare and run their own programs. At Monett High School, students utilize the facilities of General Electric Time-Sharing Services, Dallas (left). The smaller high school in the program uses a key punch (right) to prepare programs for running on the computer at the University of Arkansas at Fayetteville.

Univ. of Denver Study, 1967.

applications I have very strong convictions about the answer to this question. It should be the objective of this discussion to present different approaches that may be taken in adopting this subject to a secondary curriculum. Where applicable the author has added opinions that are the result of a comprehensive survey of other schools involved in similar programs.

Computer Science is a multi-faceted course. It should not be considered as belonging exclusively to any particular department in the curriculum. Rather, every application in all fields must be encouraged. It is very easy to identify three specific departments in the secondary school that are now, or will be in the near future, directly involved in some phase of computer usage. The three obvious departments:

1. The sciences—Including Biology
2. Business
3. Mathematics

There are others that are not so obvious but nonetheless involved. However, we shall restrict our discussion to these three.

The immediate and obvious question should be, "To what extent should these departments be involved, and can a single course apply equally well to all?" It is our personal opinion that not only *can* the course span these three subjects but it *must*. Let me hasten to add that the ideal method of adopting the subject in the curriculum would be to offer a separate course in each area. We realize this may be unrealistic

Within the junior and senior level course, students break into group sessions emphasizing the use of computers in business, math or the sciences. Programs are developed for specific subject applications.

in the initial stages but perhaps it should be a goal for the future.

There are several directions that can be taken in the initial year. Two of the more obvious will be discussed.

1. *Comprehensive*—This approach should attempt to involve as many disciplines as possible. Students should be selected from

## Programmers/Systems Analysts:

# Write your own ticket to success in business information systems!

At Pratt & Whitney Aircraft, world's leading producer of dependable jet engines, you will find everything your analytical mind desires. Myriad business applications probing ever deeper into every facet of this vast aerospace organization. Manufacturing • Product Support • Engineering • Finance • Purchasing • Advanced Planning • Operations Research. . . and much more.

Ours is one of the most advanced and sophisticated business information computer complexes in the country. We have come as far as any. We will go further than most. Projects vary from simple card systems to complex on-line systems involving, for example, a Full Production Information System, Automated Financial Analysis and Reporting, and an Integrated Material Control System which includes procure-

ment, forecasting and scheduling. Tools include 360 models 20, 30, 40 and 50; tapes and random devices; data collection equipment; on-line facilities; DOS and OS.

The total commitment of Information Systems to serving the needs of management at P&WA means real-time opportunity for EDP professionals with promise. Our Systems-Programming Analysts are exposed to virtually every phase of the business. They get to move around, and they get to move up . . . just as fast as their talents will take them. Isn't it time you talked to P&WA?

*If this sounds like your kind of action, why not send your resume with salary requirement to Mr. H. M. Heldmann, Professional Placement, Office A-43, Pratt & Whitney Aircraft, East Hartford, Connecticut 06108. An equal opportunity employer.*

**Pratt &  
Whitney  
Aircraft**

**U  
A**

DIVISION OF UNITED AIRCRAFT CORP.

A graphic illustration of the use of computers in business is made for the students by visiting the data processing departments of local businesses, such as this installation at the Vaisey Bristol Shoe Company.

the three major departments listed above. The course would of necessity be tailored to fit a variety of interests and backgrounds. This in turn would require a great deal more work for the instructor since three distinct types of applications must be allowed. Personal guidance and counseling in program development would be required. This

type of project may be too ambitious for the first year of operation.

2. *Intensive*—This approach involves students that are primarily selected from a given discipline. Strong emphasis should be placed on applications of computer usage in the subject matter under consideration. This appears to be the most desirable from the standpoint of preparation and administration. This approach should not be the end result, but rather a means to reach a comprehensive course of study. The three types of programs might be:

- A. For scientific applications—The students would use the computer to solve scientific problems. Emphasis would be placed on the computer as a tool of the research scientist.
- B. For business applications—Emphasis would be placed on data processing, information storage and retrieval and cost analysis.
- C. Mathematics—The student would learn complex and sophisticated mathematics, especially numerical analysis for computer applications.

Each of these have merit, but the ideal program would be a merging of A, B, and C, with each student learning the same material in computer science and each applying these skills to his own area of interest.

## IT WOULD BE NICE TO SAY "NO" TO A FIRST-RATE JOB OFFER

There's nothing quite like being *wanted* to give a man a lift. Unfortunately up until now, *you* have had to take the first step by indicating your availability. But what, if you're not really "available"? What if you're just *interested* in the tempo of computer personnel demand? Maybe you'd like to look into another opportunity; maybe not.

NEXT MONTH IN SOFTWARE AGE . . . you'll read about a new service—international in scope—that puts you, as a computer professional, in a position to receive solid job offers *based strictly on your qualifications*—without even revealing your name to the employer. If you like the sound of the offer, then, and only then, the employer gets your name . . . and the two of you take it from there. If you want to know more *now*, circle the reader service card. But watch for more information!

Course content is directly related to the type project selected from the previous article. In the event the first, or comprehensive, approach is followed, Computer Science should be taught as an end in itself with applications being individually selected. In any event the *computer* subject matter studied is to be identical, only the *sequence* of the course would be different. The comprehensive approach lends itself to lectures on Monday, Wednesday and Friday with Tuesday and Thursday relegated to individual research and projects.

The second or intensive program is the easier of the two to administer. The sequence of the course is altered to fit more exactly the subject matter considered. The redeeming merit of this approach is the small number of teachers required to make the project successful.

The material concerning computers follows the following rough outline:

1. Introduction to Computers and Their Uses
  - A. Definitions of Terms
  - B. Discussion of Equipment
2. Computer Languages
  - A. Fortran
  - B. Cobol
3. Computer Software
  - A. Compilers
  - B. System Action
4. Machine Logic

The material should be merged with actual computer programming. We have reason to believe

that within one month the student will have become familiar with the language to the extent that he will be writing programs to be run on an available computer.

This discussion is not intended to be exhaustive. Rather it presents in general the type of program possible for our school systems. There are other approaches and directions one may take but we feel that the methods discussed will place computer science on a strong foundation. At the end of this article is a questionnaire that will allow you to express your own opinion about the direction *you* feel secondary Computer Education should follow. This questionnaire is being sent to other interested personnel.

Expertly Written Resumes For

### Operators, Programmers, System Analysts

and other EDP Professionals

PLANNING TO FIND A BETTER JOB

Make a top first impression on potential employers with persuasive resumes prepared by experienced personnel counselors. Cost is amazingly low! For only \$5.00, we'll organize and write your job history just the way EDP executives like to see it. You also get 100 printed copies on fine bond paper plus free distribution to ten interested companies. So act now to open more doors to finer career opportunity. Write today for Career Inventory.

Box 5/A-302

## do you suffer from **TIRED CAREER?**

Perhaps you recognize some of the symptoms:

PAYCHECK ANEMIA  
PROMOTION FATIGUE  
CLIMATE BLUES . . .

The MSI consultants have the right prescription. Remove yourself from an unrewarding environment and see how the color comes back into your computer career. Right now, our clients, major corporations, need professionals in:

- BUSINESS / SCIENTIFIC PROGRAMMING
- TIME SHARING / REAL-TIME
- SOFTWARE DEVELOPMENT
- SYSTEMS DESIGN
- OPERATIONS RESEARCH
- SYSTEMS ENGINEERING
- MARKETING / SALES
- TECHNICAL SUPPORT

Send your resume in confidence, including salary and geographic requirements. Our clients assume all fees.

(212) 532-7710

Career Planners: DATA PROCESSING & MANAGEMENT SCIENCES

## Data Processing Manager

We are seeking an individual who has the creativity, enthusiasm, desire and ability to supervise the EDP systems department of our general offices in Chicago. Our beautiful new plant, located on the residential Northwest side, provides a pleasant atmosphere for this corporate level position. As a leader in the field of electronics, continued growth and expansions present a constant challenge to all departments.

This position requires a strong systems background in a manufacturing environment and a knowledge of programming. Some college is preferred.

Salary commensurate with ability. Liberal company benefits including profit sharing.

Send resume and salary requirements to:

Mr. Jack Adolf  
C. P. CLARE & CO.  
3101 W. Pratt  
Chicago, Illinois 60645

Programmers and systems analysts:

# Sooner or later you're going to want a better job.

## If it's sooner, complete the coupon below.

It's the shortest cut we know to some of the best job opportunities to come along in a long time.

How do we know?

We know because we are Conductron/Mo., Texas Instruments, Scientific Control, Burroughs Corporation, Control Data Corporation, Honeywell, Eastman Kodak, A.C. Electronics/Div. of General Motors, General Electric Corporation, Collins Radio, McDonnell-Douglas, Sikorsky/Div. of United Aircraft Compress, Bendix, Raytheon Co., Perkin Elmer, Sperry Rand and other top companies which attend Career Centers.

We get together because, just as one of our Career Centers gives you the broadest possible choice among jobs, it gives us the best possible chance to interview and hire large numbers of engineers and scientists in just a few days.

To make certain you're in line for the choicest of these jobs (jobs paying from 10K to 28K) it's important for you to pre-register for the Career Center that's scheduled to visit your locality.

We will evaluate your qualifications—minus your name and address—well before the Center begins. Our representative will arrange a personal, private interview schedule for you with those of us you are interested in meeting. Even if your present employer is there, he won't know you are.

So, the sooner the better. And nothing could make it sooner than filling out and mailing the coupon today. We'll have a complete registration kit in your hands before you know it. Another thing, there are never fees for you to pay.

**Meet us in Boston during SJCC at the Parker House Hotel, 60 School St., May 13-15, 9 am to 9 pm. Call (617) 227-3110.**

Equal Opportunity Employer

Mr. S. Anders, Career Center, 635 Madison Avenue, New York, N.Y. 10022

I plan to attend the Center(s) checked below. Please send me full information.

- May 13-15 Boston (SJCC)
- May 21-22 New York
- May 27-28 Minneapolis
- June 5-6 Los Angeles
- June 10-11 Palo Alto
- June 19-20 Chicago
- June 26-27 Philadelphia
- July 1-2 Washington, D.C.
- July 10-11 Pittsburgh
- July 17-18 Boston
- July 24-25 Paramus, N.J.
- July/Aug. 31-1 Minneapolis
- August 7-8 Dallas
- August 14-15 Los Angeles
- August 18-22 San Francisco (WESCON)
- August 28-29 Philadelphia
- September 4-5 Rochester
- September 11-12 Boston
- September 17-18 New York
- September 25-26 Washington, D.C.
- October 2-3 Chicago
- October 9-10 Palo Alto
- October 14-15 Los Angeles
- October 16-17 San Diego
- October 23-24 Philadelphia
- October 29-30 New York

Career Center is not coming to my city in the near future, but please register me for consideration by employers attending all Career Centers.

In Barry County we are taking what we consider to be the total approach. We are attempting to involve as many people in the program as we can possibly reach. This has been very successful thus far. We are reaching secondary students, secondary teachers, administrators and community people. If the communications barrier is to be broken, a concerted effort must be made to destroy the myths that have been established about the subject of computers. Following is a description of the program that we have established in Barry County:

1. Two county high schools are now teaching a full academic year course to juniors and seniors. The larger of the two schools is utilizing General Electric Time-Sharing Services out of Dallas, Texas. The other is running student programs on the computer located at the University of Arkansas at Fayetteville, Arkansas. Neither of these programs reflect the optimum hardware set up. They are doing quite well.
2. An extension course has been established by the University of Missouri at Rolla for the teachers of the county and any other interested individuals. The course carries three semester hours credit. Currently we have enrolled 14 teachers and administra-

tors, and four community participants are auditing the course. All programs are being run on the University computer. It is interesting to note that the teachers are drawn from several disciplines including Mathematics, Science, Business, Electronics, and Auto Mechanics.

3. The Area Vocational School located at one of the schools of the county is offering an evening course for post-high school students who are interested in computer work.
4. In cooperation with the University of Missouri at Rolla, one of our high schools has received National Science Foundation funds to conduct a Summer Institute in Computer Science to be held at the local school during the summer of 1969. The Institute will train teachers of secondary schools sufficiently to conduct a Computer Science program in their own school during the 1969-70 school year.

It is quite obvious that the program is developed to spread this subject as wide as possible and to involve as many people as possible. The people of the county may find that when this year is complete that they have a tiger by the tail and cannot let go even if they wish to. This is our intention. ■

### Questionnaire

**Computer Science Curriculum Committee  
Box 446, Purdy, Missouri 65734**

*(Questionnaires returned to S/A will not be forwarded)*

1. Your position and title .....
2. Major application. Check one  
A. Scientific Application .....
3. Computer Language used .....
4. Highest degree or diploma held and major field .....
5. Do you feel that Computer usage should be taught in the secondary schools? Yes .....
6. If your answer to the preceding question was yes, which language(s) do you think should be taught? .....
7. In your opinion do you feel that high school seniors can comprehend an assembler language? .....
8. Which of the following do you feel most closely fits your philosophy of Computer Science. (Check one)

1. Computer Science as a subset of an advanced mathematics course .....
  2. Computer Science as a subset of an advanced science class .....
  3. Computer Science as a subset of an advanced business class .....
  4. Computer Science as a unique subject .....
  5. None of these .....
  9. If your response to the above was number 5, please describe briefly your own opinion about course content. ....
  10. May we correspond with you in the future about this matter? Yes ..... No .....
- Address .....

## 5. FORTRAN PROGRAMMING

By FREDRIC STUART, Hofstra University.

**Contents:** Index of FORTRAN Compilers. Tables. Introduction. Introduction to FORTRAN. Expansion of Computation Techniques. Input Statements—Conditional Branching — Flow Charts. Execution-Time Options — DO Statement — Integer Values. Format Statements. Subscripted Variables. Other Conditional Branch Statements. Subprogram Arrangements. Other Variable Types. Other Nonexecutable Statements. Operating Systems. Some Programming Techniques. Appendices: Test Output for Exercise Programs. Summary Comparison of FORTRAN Compilers. Index.

1969 353 pages \$7.95

## 6. A GUIDE TO FORTRAN IV PROGRAMMING

By DANIEL D. McCracken, McCracken Associates, Inc.

**Contents:** Fundamentals of FORTRAN Computation. Transfer of Control. Double Precision, Complex, and Logical Variables. Subscripted Variables. The DO Statement. Input and Output. Functions and Specification Statements. Appendices: Actual FORTRAN IV Implementations. Statement Punctuation: Operator Formation Rules. Basic Supplied Functions. Answers. Index.

1965 151 pages \$4.50

## 7. A GUIDE TO COBOL PROGRAMMING

By DANIEL D. McCracken.

**Contents:** Electronic Data Processing and COBOL Computer and Punched Card Equipment. The Procedure Division. Case Study 1: Sales Statistics. The Data Division. The Environment and Identification Divisions. Case Study 2: Inventory Control. Additional Procedure Division Features. Object Program Efficiency. Case Study 3: Payroll—System Design to Startup.

1963 182 pages \$5.95

## 8. AUTOMATIC DATA PROCESSING System/360 Edition

By FREDERICK P. BROOKS, JR., University of North Carolina, Chapel Hill; and KENNETH E. IVERSON, Thomas J. Watson Research Center, IBM.

**Contents:** Fundamentals of Data Processing. Manual Data Processing Equipment. Punched Card Equip-

ment. Computer Coding. Computer Organization. Programming. Searching and Sorting. Programming Systems. System Design. Index.

1969 Approx. 485 pages \$14.50

## 9. SYSTEM/360 ASSEMBLER LANGUAGE

By DON H. STABLEY, Eastman Kodak Company.

**Contents:** Assembler Language Instruction Formats. Fundamentals of System/360 Addressing. Establishing Constants and Areas. Commands—Op Codes and Explanations. Floating-Point Decimal Math Generalities. Initializing the Program and Assignment of Base Registers. Binary Bit Position and Respective "Power of 2" Values. Conversion of Hexadecimal Core Dumps. Sample Problems and Probable Answers.

1967 129 pages \$5.25

## 10. COMPUTER SCIENCE: A First Course

By ALEXANDRA I. FORSYTHE, Gunn High School, Palo Alto, California; THOMAS A. KEENAN, Director, Educational Information Network, EDUCOM; ELLIOTT I. ORGANICK, Professor and Chairman, Department of Computer Science, University of Houston, Visiting Professor at MIT, and affiliated with Project MAC; and WARREN STENBERG, Associate Professor, Department of Mathematics, University of Minnesota.

**Contents:** BASIC CONCEPTS. Foundations. The Flow-Chart Language. Additional Flow-Chart Concepts. Looping. Approximations. NUMERICAL APPLICATIONS. Functions and Procedures. Some Mathematical Applications. More Mathematical Applications. NONNUMERICAL APPLICATIONS. Trees. Compiling. More on Tree Search and Storage Structure Concepts. Lists and Strings: Their Storage Structures and Uses. More Aspects of Compiling. Appendices: Review. Getting Things Started. A Review of the Eleven Basic Instructions. Some Illustrative Problems. Problems Related to Indexing. Indexing Instructions and Their Use in Loops. Shifting Instructions and Their Use in Real Arithmetic and Character Manipulation. Finding Values in a Table. The Use of Subprograms. Index.

1969 Approx. 512 pages In press

■ Additional supplementary materials include: *Computer Science: A Primer*, a short version of the title; *FORTRAN Language Programming*; *Basic Language Programming*; and a *Teacher's Commentary*.

# new products

Fimaco, Inc. of Philadelphia has developed a new simplified computer language, **BOCOL** (Basic Operating Consumer-Oriented Language).

BOCOL uses clear, precise statements thereby reducing learning time. Even the novice programmer who has written one or two programs no longer needs to refer to the manual of operation.

Input of information of environment, equipment and formatting do not require separate definition. Also, BOCOL requires only one pass for compiling and processing. In these two ways machine and programming time are decreased and efficiency, productivity and economy are increased.

BOCOL statements consist of certain "key words" and as much "free wording" as the user desires. Multiple statements may be written to form sentences of any length which may be organized to form BOCOL paragraphs. One or several paragraphs may be ordered into subroutines.

The Potter instrument company has announced the development of a new concept in **unit record equipment**.

The key to the new system is a magnetic bar code with an associated alphanumeric character printed on cards of key punch size. The coded characters are both man and machine readable by a Potter printer, model HSP-3502A operating as an off line print station. The unit is a standard Potter high-speed printer specially adapted to print the magnetic characters required in the new system. Manual card preparation can be accomplished by using a modified standard typewriter.

A magnetic mark card reader is used to read the six-line cards produced by both the printer and the typewriter. The unit can read at 300 cards per minute.

The hole-free, readable cards are designed to be an effective and convenient turnaround document which could be especially useful for utility billing and similar applications.

Arthur S. Kranzley and Company of Cherry Hill, New Jersey has announced the development of the **CHARGE-SERV** sys-

tems for **computerized processing of accounts receivable**. CHARGE-SERV Systems are said to be applicable to auto rental chains, oil companies, hotels and restaurants, as well as to large retail stores and chains.

CHARGE-SERV Systems are interrelated-groups of computer programs that facilitate credit control and perform the charge card accounting functions. Written in COBOL for an IBM 360 (Model 30 and higher) computer with at least 65K bytes of core storage, CHARGE-SERV programs can run on other manufacturer's equipment as well and can be readily modified to meet changing demands.

Documentation furnished to users includes a magnetic tape or card deck for reproduction and system and run books for each program. Copies of computer related forms and on site guidance are also provided as part of the Systems.

A new small magnetic core memory has been placed on the market by Ampex corporation. The core memory, model 3DM-3000, is complete on one plug-in module 1.2 inches high, 7 inches wide and 12 inches deep.

The new Ampex memory is designed for use as a buffer memory in data terminals and acquisition systems, as a data-refresh memory for display devices, and in a wide variety of applications requiring a small, economical core memory where reliability is critical.

The 3DM-3000 ranges in price from \$330 to \$950 in production quantities, with capacities up to approximately 100,000 bits. It offers an access time of 1.2 microseconds, a half-cycle time of 1.5 microseconds and a full cycle time of 3 microseconds. It uses a 3-D, 5-wire magnetics design for maximum economy and reliability.

The capacity of the 3DM-3000 may be expanded by adding up to eight plug-in modules in an easy-fit metal drawer 5.25 inches high. The basic memory module accommodates 128, 256, 512 or 1,024 words by 4 to 12 bits. The maximum capacity, using all eight modules, is 8,192 words by 12 bits.

A special data terminal announced by OMNITEC Corporation is designed to give each teller direct access to information stored in a bank's central computer.

At the touch of a finger a depositor's balance, interest, payment amounts or other information can be immediately checked. Queries are originated through simple codes and depositors are identified by account number.

The OMNITEC terminal converts keyboard pulses to selective audio tones for data transmission over standard telephone lines to the bank's central computer. Queries are automatically processed and answers are instantly returned in the same manner and printed out on paper tape at the teller's terminal.

The data terminal has a special numeric keyboard for inputting information to a central computer and a strip printer for hard copy printout. The terminal contains its own telephone coupler which uses a standard office phone handset to provide the communications link to and from the computer.

The terminal was originally designed for banking applications, but there is some indication that a variety of other businesses including insurance companies, airlines, libraries, universities, and stock brokers may find use for the unit.

\* \* \*

Redcor Corporation has announced the development of a **midi-computer, the RC-70**. The 860 nanosecond, 16 bit computer features an 8K memory (plug-in expandable to 32K), memory parity, memory protect, bi-directional index register, high speed multiply and divide, direct memory access, priority interrupt and ASR 33. The machine was designed to fill the gap between the high priced 32-CPU's and the lower priced, lower capacity mini-computers. The RC-70 includes a full complement of operational software, with single pass assembler, FORTRAN IV (ASA standard), math subroutines, utility package, and diagnostics.

on the Reader Service Card*

## "We're looking for the kind of men who can build Compress into one of the largest data processing firms in the country."

About six years ago we started with \$2,500 in assets, today it's \$40,000,000; and in the not too distant future, we expect to be the largest software house in the data processing field. When we are, the people who'll join us this year will probably be managing their own departments and hiring many more to staff and perhaps manage their own groups.

Compress intends to be the established leader in the country's fastest growing business—computer services.

If this strikes you as ambitious, you're right. If it strikes you as impossible, well, maybe you're not for us and you might as well stop reading right now.

### Where we're going

I think few would argue about the growth potential of the computer services field. So let me dwell exclusively on Compress.

First of all, we start with a pretty uncommon record. Our average growth in sales and profits has exceeded 90 per cent per year since we formed six years ago. Our staff numbered 200 last year and will be up to 325 by year end. Our entire growth has been financed from retained earnings, and we've been successful enough to have invested in several affiliated corporations—including Comcet, a new communications computer systems manufacturer; Comnet, one of the few profitable time-sharing firms; Computer Microtechnology, an advanced memory manufacturer; and Commed, a company using computers to serve the medical field.

Our services, too, are uncommon. Initially, we formed the company to develop and market a dynamic simulation program called SCERT—a simulator that would allow our clients to compare the cost, performance and operational aspects of any real or conceptual computer system.

SCERT has become so widely accepted that it has been used by more than 200

top EDP users and by most major hardware manufacturers in the United States and Europe.

SCERT also saved its users enough time to accelerate their need for software development. And they sought out our help. Because of the technical advantages SCERT and our other proprietary systems had given us, Compress was best qualified to help them plan and implement their complete data collection, processing, and communications systems most quickly and most economically.

### The future for us

This year marks the introduction of MINI-SCERT. A package designed for the medium and small EDP user. As a result, our client list will grow astronomically. We alone can offer this simulation program assistance. We're so sure of this—that we only quote fixed price contracts—how's that for confidence!

To continue to soar, a company needs only three things—superior products and services, a dynamic and expert management group, and the best people it can possibly find.

We have a clear lead in our products and services, a lead that was highlighted when the founders of Compress, received the 1968 Small Businessman of the Year award. We have developed a management team that few firms can match—some of the best regarded, most successful men in the industry are part of that team. And as for our technical staff—we have a superb group and we're intent on adding only the best.

An indication of the way our people view the future of Compress and the challenge of the work they do, is to look at our employee turnover records. In this past year, we had only three professional people who chose to quit. One formed his own company, another returned to school, the third joined a competitive firm. Few companies in this or

any industry have employee satisfaction this great.

### The people we need

We're looking for pros—programmers and analysts with an absolute minimum of two to three years experience on third generation systems. The more systems variety and experience, the better.

Everyone we hire must be able to communicate persuasively—in both personal presentations and in writing.

We have immediate openings in Washington, New York, Philadelphia, Chicago, Los Angeles, Pittsburgh and London. We'll soon have more in San Francisco, Houston, Detroit and Atlanta.

### The offer we make

You'll start at a top salary; the specific figure depends on your experience and background. And you'll be able to participate in our comprehensive stock option plan.

Full training is provided, and you'll be assigned to the group where your background and experience will show immediate results. We'll work with you for your choice of follow-on assignments to develop your professional skills and meet your personal goals.

Past experience indicates that if you've got it, in an average of two years you will be in line for a management position. Our sustained growth dictates rapid promotion of our good people to positions of increased responsibility. Your speed of growth will be fully up to you.

If Compress sounds right for you and your goals, just send a copy of your resume to me. I'll see that your resume is put into appropriate hands and an interview will be scheduled either in Washington or one of our branch offices. Write: Fred C. Ihrer, President, Compress, 2120 Bladensburg Road, N.E., Washington, D.C. 20018.

# better books

by *Dennie Van Tassel*

*Mr. Van Tassel is the head programmer at San Jose State College, California. He has been in data processing since 1957, and handles book reviews for several newspapers in addition to his software duties. He holds a B.A. in English from the University of Southern California, and a M.A. in mathematics from California State College at Los Angeles.*

**MATHEMATICAL PROGRAMMING IN PRACTICE** by E. M. L. Beale London: Sir Isaac Pitman & Sons, Ltd., 1968, \$4.80.

This book is based on lectures given on a nine-week course on operational research, run by C-E-I-R Ltd. While the book only requires some elementary algebra and a little matrix notation, the author does state that the book is not designed for anyone who takes a pride in his ignorance of mathematics.

The first part of the book covers

the conventional material on linear programming, including the simplex method, transportation method, duality problem, parametric programming, and the inverse matrix method. If this was all the book had, it would just duplicate many good books already out on linear programming. But the author has added a section on organization of linear programming calculations, which attempts fairly successfully to show the reader how to actually set up a linear programming problem.

The last part of the book describes special procedures that go beyond the simplex method for linear programming and are now applied to practical problems. These include adding non-linear constraints or a few integer variables to an otherwise purely linear programming problem.

The last part of the book describes special procedures that go beyond the simplex method for linear programming and are now applied to practical problems. These include adding non-linear constraints or a few integer variables to an otherwise purely linear programming problem.

**PROGRAMMING SYSTEMS AND LANGUAGES.** Edited by Saul Rosen. McGraw-Hill. 730 pages. \$12.50.

**CONVERSATIONAL COMPUTERS.** By William D. Orr. John Wiley & Sons. 227 pages.

**FIRM**, by John McLaughlin. Dow Jones-Irwin, Inc. Homewood, Illinois, 1966. \$6.50.

Compared to a clerk performing elementary arithmetic operations a computer is ten million times faster and has a cost of 1/100 of 1 percent. The first industrial revolution eliminated manual labor with the use of energy-producing machines, and John McLaughlin, the author, predicts that the second industrial revolution could bring about the elimination of work altogether. McLaughlin bases this prediction on the fact that within the United States well over 90 percent of the effort of the productive capacity of the economy is in information processes. The revolutionary aspect of the electronic information machine is that it has the power to reduce the cost of these operations by a factor of more than 100 to 1.

The author makes several other predictions, such as: The small bank cannot long survive since the major effort in their business is the processing of information and a larger bank is usually much more efficient. Whole industries have become dominated by information processing, such as: banks, warehousing, and research.

The author feels that economical efficiency should be the main goal of computer-oriented efficiency. McLaughlin even expresses the unusual opinion that education and research should be given a lesser emphasis than economical efficiency.

The author has done a lot of research for this book. He uses specific examples ranging from supermarkets to Volkswagons to support his views.

Although the book has much non-technical information on the effect of modern information processing he offers little advice on industrial survival except that bigness seems to be the most common defense.

## PROGRAMMERS

### BOLD CHALLENGES IN DATA PROCESSING!

The name of the game is "Do a better job—faster!" We play it all the time at the Army Air Force Exchange Service—the civilian organization which serves the Armed Forces personnel through "PX" and "BX" outlets—where we seek more and better EDP information to improve our performance in retailing!

If you enjoy a challenge, and the opportunity to show what you can do with excellent equipment and professional associates, your route to success may be with us! We need:

## COMPUTER PROGRAMMERS

You'd be writing specific programs to organize and process our management information by the most rapid and meaningful methods.

Our EDP division is fully equipped with 360 MOD 20/30/40 Disk/Tape/Card systems using ALC or COBOL, and staffed with real professionals who know how to use them!

**\$9,000—\$10,000**

You'll need a degree in computer science or its equivalent, plus at least one year of 360 experience.

In addition to a good starting salary, you'll receive outstanding fringe benefits, including life insurance, family coverage in our hospital—medical—surgical plan, liberal vacations, sick leave, retirement programs, and opportunity for advancement and promotion throughout our worldwide network. We try to promote from within—so you have an opportunity for great personal growth!

Relocation expenses will be paid.

If you qualify, AIRMAIL your resume, which must include SALARIES EARNED, to:

two weeks.)

Equal Opportunity Employer

scientist instead of the mathematician or engineer.

The book has twenty-nine FORTRAN programs in the text along with numerous smaller examples including flow charts which illustrate programming techniques of interest to the behavioral scientist. The book is a good text for those that wish to pick up an additional program language for occasional use such as COBOL programmers.

**MANAGEMENT OF AUTOMATIC  
DATA PROCESSING SYSTEMS**  
by Marvin M. Wofsey. Thompson Book Company, Washington, D.C. 1968.

While this book is primarily intended for senior managers of companies, including managers of data processing, programmers and systems analysts will also find that this book offers them some interesting reading. For Wofsey is writing for the informed reader and does not belabor the obvious for the general public. The book concentrates on the problems of organization and communication and explores the desired characteristics of upper level people in data processing.

Subjects explored in this book are presented to the reader concisely in the following chapter headings: Objectives of Data Processing, Organization, Selection of Personnel, System Design, External Relations, Training, Costs, Review and Evaluation Outlook. Mr. Wofsey begins with a brief look at trends in data processing during the last twenty years. He cites that in the 1950's the primary objective of automatic data processing was usually reduction of clerical costs; but now data processing has become a tool to revolutionize management methods.

The merits of selection of personnel from within a company as compared to the advantages of selecting personnel from without the company are given in one chapter. The real question being discussed is whether it is better to select people who know the business but not the computer, or people who know the computer but not the business.

The subject of communications and its relationship between the data processing department and other departments within a company is treated in the chapter, "External Relations". Also given are methods and philosophies of decision influencing, hints on how to instigate coopera-

tion, allay fears, and how to educate people not only so they can furnish better input data but also so they can be helped to obtain more effective uses of data problems. All of these topics are almost universal problems in data processing.

One of the most interesting sections in the book deals with the establishment of methods to review the overall effectiveness of a data processing setup. Suggestions are included on how to select a review committee as well as desirable objectives. A sample review helps complete this section.

The author closes with an outlook, summary and an outstanding bibliography which will be of some value to anyone desiring to do further reading on any of the topics mentioned in the book.

**COMPUTERS AND COMMUNICATIONS**—Toward a Computer Utility. Edited by Fred Gruenberger. Prentice-Hall. 219 pages. \$10.50.

Many of the leaders who have shaped the computer utility concept are represented in this book which was built from a collection of papers which were presented at a Computer Communications Symposium, jointly sponsored by Informatics Inc. and UCLA in 1967.

The articles are very easy to read and cover a wide spectrum of potentials and problems concerning a computer utility. Among the problems discussed are true costs, monopoly, regulation, public welfare, privacy and protection, software and hardware requirements, social implications, Federal regulations, and marketing.

The main concern of the book is the role of the computer utility in business, education, medicine, and in governmental services. This book will provide both fascinating and informative reading to those who are interested in the possibility of a computer utility.

**THE TALE OF THE BIG COMPUTER** by Olof Johannesson. New York: Coward-McCann, Inc. 1968. 126 pages. \$4.00.

The tale here is the history of computer evolution as told by a big nameless computer several computer generations from now. The book is both interesting and humorous and offers the views of the author on

## computer project coordinators systems analysts programmers

Allis-Chalmers, a progressive, internationally known manufacturer, offers challenging assignments for project leaders, systems designers and programmers.

These positions require a college degree plus successful previous experience in one of these commercial computer system applications: Finance, Marketing, Manufacturing, Administration (Employee Systems, Telecommunications, Project Networking, Inquiry), Engineering, Accounting.

Qualified candidates can experience the satisfaction of participating in propelling a good company into a great company while enjoying an excellent salary, fringe benefits, and growth opportunity. Send resume in strictest confidence to:

Richard M. Bird, Corporate Systems  
Allis-Chalmers, Box 512  
Milwaukee, WI 53201

 **ALLIS-CHALMERS**

An Equal Opportunity Employer

#### BUSINESS SYSTEMS ANALYSTS AND PROGRAMMERS

Junior and senior level positions available for systems analysts and programmers who have several years' experience in any of the following areas: engineering specifications, bills of material, engineering change control, inventory control, production planning, quality control, cost determination, cost control, payroll, accounting. Prefer degree in business or related disciplines and experience in multi-programming, direct-access storage, disc files or large-storage media and thorough knowledge of COBOL.

# Programmers Engineers

NCR Los Angeles  
offers you fourth-generation  
opportunity today

#### SYSTEMS ANALYST ENGINEERS

Junior and senior level positions available for ENGINEERS, ANALYSTS and PROGRAMMERS who have several years' experience in any of the following areas:

Systems analysis and evaluation of business systems. Selected applicants will determine and participate in the establishment of either small processor systems or a large multi-processing system.

Study and development of on-line systems in business data communication environment.

Evaluation of multi-programming, multi-processor time sharing systems using simulation techniques.

#### ADVANCED DEVELOPMENT ENGINEERS

Positions available for senior MECHANICAL and ELECTRONIC engineers with strong experience in high-speed mechanisms and mechanical, hydraulic, and electro-mechanical mechanisms.

Also senior level positions in logic and circuit design for engineers with knowledge in MSI and LSI circuitry for fourth-generation computer systems.

These positions require BSME/BSEE and five years' related experience.

#### SOFTWARE PROGRAMMERS

To design, code, de-bug and document operating systems software or on-line executive software modules. Prefer degree in business or a science discipline and/or experience in systems programming.

#### NOW INTERVIEWING

Interviews are now being held for these positions, all of which are currently open. To schedule an appointment in your area or in Boston during the Spring Joint Computer Conference, May 14-16, please send a detailed resume, including salary history, to Jerry Hill at the address below.

the evolution of future computer systems.

The author knows quite a bit about computers and their potentialities. Information systems, CAI, computerized factories, and computer wrist apparatuses are just some of the subjects covered by the author. The author accurately portrays present accomplishments and then smoothly covers their historical development into the future.

The book has a great deal of humor and social criticism in it because the tale is told by a computer which gives a rather condescending but accurate description of man's shortcomings.

Man is described in an ethnocentric manner that is, in comparison to a computer. Thus man's ability to solve mathematical problems is highly valued and man's ability to use fire is downgraded. The computer ranks man's inventions of electricity and radio as his most important accomplishments since they paved the way for computers.

Time is recorded in nano-seconds and starts at the end of B. C. (Before Computers). In describing the present age the author states that violence had largely been abolished except among gangsters, politicians, and soldiers.

Because of their inability to survive change and overcome their impracticability, big cities are compared with dinosaurs. With the advent of mass information systems and modern transportation, big cities were no longer necessary.

Olof Johannesson presents the following rather amusing version of how governmental bureaucracy opposed all measures to eliminate itself and be replaced by a computer but at the same time fell further and further behind in its decision making. Since most of the efforts of the bureaucracy were directed in maintaining their positions it was forced to keep delegating more and more responsibility to the computer and was finally replaced automatically by the computer. The bureaucracy made a desperate attempt to retain power, but as none of the members knew how to program a computer the attempt failed.

This book offers astute reflection of both the present and future growth of computers and should prove very interesting, enjoyable reading. ■

# ADVANCEMENT OPPORTUNITIES OF YOUR CHOICE LOCALLY AND NATIONALLY

If you are interested in exploring advancement opportunities in a personal and confidential manner contact us! We will bring our client companies to you, offering you advancement opportunities of your choice both locally and nationally. We represent over 150 companies from coast to coast with no fees or charges to you.

During the last three years we assisted over 5,000 programmers, engineers and systems analysts in their search for advancement opportunities. The opportunities were at all levels with starting salaries from \$10,000 to \$30,000. We visited over 30 cities to bring our client companies to you.

How does our service work? After you contact us we will evaluate your qualifications and refer you to our select clients—minus your identity. When interest is expressed we will contact you to review the companies and their opportunities. An appointment of your choice and convenience will be established, most likely in your locale since we will be visiting eighteen cities in the next ninety days.

Contact us today and we will introduce you to opportunity tomorrow.

# The Source Edp Computer Salary Survey and Career Planning Guide 1969 Edition

The all new 1969 Edition of Source Edp's Computer Salary Survey and Career Planning Guide is now available. This comprehensive 20-page report contains up-to-the-minute information vital to every computer professional. Subjects include:

- The annual Source Edp Survey of Computer Salaries broken down by 28 separate levels of professional and managerial classifications ranging up to \$75,000.
- A comprehensive analysis of current trends in computer employment opportunities.
- For the first time, a study of information proc-

essing development within major industrial classifications including user and non-user industries.

- For the first time, an examination of the techniques and strategy in career planning.

All of this information has been compiled and edited by the people at Source Edp—the largest nationwide recruiting firm devoted solely to the computer field. To receive your free copy of the 1969 Edition of Source Edp's Computer Salary Survey and Career Planning Guide, circle the reader inquiry card. Or, to speed delivery, write directly to the Source Edp office nearest you.

**WE'LL BE LOOKING FOR YOU AT THE SJCC.**

Source Edp people will be on hand at the SJCC in Boston to talk with any interested computer professionals. You'll find us at the Sheraton Plaza Hotel. Or you can call (617) 227-8125 for an appointment.

Stop by and pick up your free copy of the 1969 Computer Salary Survey and Career Planning Guide.

# Beyond Operating Systems...

... Mellonics staff members are defining the next generation of large-scale information handling systems. Our present major activity is the design and development of advanced data system software for the Air Force; current openings are for analysts and programmers with two or more years' experience in OS/360. Emphasis is on:

- OS internals assembly language programming, including a knowledge of system functions in such areas as job management, task supervisor, IOS (including support for non-IBM peripherals), and data management techniques; and
- OS externals, such as PL/I applications programming, application of system utilities, system maintenance, and familiarity with system generation tasks.

*These openings are for specialists in these areas, but we would also like to talk with those who have senior, across-the-board expertise.*

*Mellonics, the computer software arm of Litton Industries, has an enviable record of past achievements in large-scale, real time systems design. Current projects cover the spectrum of systems and applications from advanced space programs to man/machine communications.*

*For prompt, professional consideration, send your resume to our Industrial Relations Manager, Russ Kiessig, at division headquarters: 1001 West Maude Avenue, Sunnyvale, California 94086. Or better yet, see us at the Spring Joint in Boston.*
