NOTES:
1. FOR DRAWING DIRECTORY REFER TO: B-DD-M7172-Φ.
2. REF DESIGNATIONS C64 THRU C69 ARE NOT USED.
3. E6 E33 AND E62 ARE SPARE IC LOCATIONS.
4. UNLESS OTHERWISE SPECIFIED THE FOLLOWING PIN NUMBERS APPLY.

PACKAGE TYPE	+5.0V	GND
16 PIN DIP	16	8
14 PIN DIP	14	7
IC. 75452	8	4
IC. 8640	8	1

ETCH CUTS SIDE #1 AS SHOWN
1. CUT ETCH AT E19 (8)
2-3-4. CUT ETCH AT C62, THREE PLACES.
5-6-7. CUT ETCH AT C63, THREE PLACES.

ETCH CUTS SIDE #2 AS SHOWN
1. CUT ETCH AT E28 (13)

WIRE ADDS SIDE #1 AS SHOWN
1. ADD WIRE FROM E19 (9) TO P.T.H. AT E19 (8)
2. ADD WIRE FROM PTH CONNECTED TO FINGER CM1 TO E53 (6)
3. ADD WIRE FROM E28 (13) TO E24 (5)
4. ADD WIRE FROM PTH CONNECTED TO FINGER CL1 TO E53 (7)
5. ADD WIRE FROM PTH CONNECTED TO RIØ TO E1Ø (1).
6. ADD WIRE FROM PTH CONNECTED TO R11 TO PTH NEAR E5Ø (1).

COMPONENT CHANGE
1. CONNECT ONE LEAD OF C62 TO R9 AND R1Ø.
2. CONNECT ONE LEAD OF C63 TO R11 AND R12.

1. FOR DRAWING DIRECTORY, REFER TO: B-DD-M7173-0
2. UNLESS OTHERWISE SPECIFIED, THE FOLLOWING PIN NUMBERS APPLY:

PACKAGE TYPE	VCC	GND
14 PIN DIP	14	7
16 PIN DIP	16	8
I.C. DEC 8640	8	1
I.C. DEC 75453	8	4

3. THE FOLLOWING REF. DESIGNATIONS ARE NOT USED: C85 THRU C109, W1 THRU W5 & W10.

ETCH CUTS SIDE #1 AS SHOWN:

1. CUT ETCH FROM E46(7) TO E41(2)
2. CUT ETCH FROM E47(2) TO P.T.H. CONNECTED TO E47(2)
3. CUT ETCH FROM E65(15) TO P.T.H. CONNECTED TO E65(15)
4. CUT ETCH AT PTH NEAR E71 (7).

5-6. CUT ETCH UNDER E86 AT E86(3). TWO PLACES.

7. CUT ETCH BETWEEN E44(5) AND E44(6).
8. CUT ETCH BETWEEN E71(10) AND E71(11).
9. CUT ETCH AT E72(4).

ETCH CUTS SIDE #2 AS SHOWN:

1. CUT ETCH FROM E65(16) TO E65(14)
2. CUT ETCH FROM P.T.H. NEAR E44(8) TO P.T.H. NEAR E45(13,14)
3. CUT ETCH AT E71(5).
4. CUT ETCH AT P.T.H. NEAR E71 (6).
5. CUT ETCH AT E44(10).
6. CUT ETCH AT E44(12).

WIRE ADDS SIDE #1 AS SHOWN:

1. ADD WIRE FROM E46(7) TO P.T.H. CONNECTED TO E44(9)
2. ADD WIRE FROM E47(2) TO E50(5)
3. ADD WIRE FROM E65(16) TO P.T.H. PREVIOUSLY CONNECTED TO E65(15)
4. ADD WIRE FROM E65(15) TO E65(9)
5. ADD WIRE FROM E45(7) TO P.T.H. NEAR E45(13,14)
6. ADD WIRE FROM E71(12) TO E71(7).
7. ADD WIRE FROM E77(B) TO E71(1).
8. ADD WIRE FROM E86(1) TO E71(5).
9. ADD WIRE FROM E86(3) TO E81(4).
10. ADD WIRE FROM E44(8) TO P.T.H. PREVIOUSLY CONNECTED TO E44(12).
11. ADD WIRE FROM E54(2) TO E44(10). DO NOT SOLDER.
12. ADD WIRE FROM P.T.H. NEAR E77(11) TO E54(2). SOLDER #11 AND #12.
13. ADD WIRE FROM E44(11) TO E44(12).

1.0 GENERAL DESCRIPTION

The primary function of the XM15 is to receive and process all requests made to memory. In addition, the XM15 provides mounting space and power for the Automatic Priority Interrupt (API) module.

The XM15 contains power, I/O bus interface, memory bus interface, and various control functions for the operation of the M7176 Automatic Priority Interrupt logic, the M7175 Memory Management logic, the M7174 Instruction Prefetch logic, and the M7173 Memory Port. The various XM15 functions are discussed in the following paragraphs.

1.1 Individual Module Description

M7176 Automatic Priority Interrupt (API)

The M7176 API provides eight levels of priority interrupts for the XVM System. Of these eight levels, the upper four are assigned to I/O devices and are initiated by flags (interrupt requests) from the devices. The lower four levels are programming levels and are initiated by software requests. High data rate or critical devices are assigned to high priority levels and can interrupt slower device service routines. M7176 holds the lower device interrupt request until it can be serviced. The source of the interrupt is also directly identified, eliminating the need for flag search routines.

A self-starting, high resolution (18 bits) task accounting clock is also contained on M7176. The accounting clock provides essential data that allows accurate appropriation of machine cost among multi-users of the XVM System. A single IOT reads and clears the contents of the task accounting clock register.

M7175 Memory Management

The M7175 provides the XVM System core memory with protect features to trap HALT, IOT, OAS and chained Execute instructions and the addressing of a non-existent memory bank. A boundary register and two relocation registers, and associated control logic, are used to establish the limits of the user's program and relocate the program upward in memory from the real machine location.

	SIZE	CODE	NUMBER	REV
	A	SP	XM15-0-5	A

DEC FORM NO DEC 16-(381)-1022-N370
DRA 108

The boundary register functions in two modes; protect and relocate. In the protect mode the boundary register sets the lower memory limit for the user's program. In the relocate mode the boundary register establishes the upper memory limit for the program, while the lower limit is established by the first relocation register. The second relocation register, called the share register, provides for memory segmentation in a multi-user environment.

In addition, there are software controlled modes which allow:

a. selection of indirect addressing with 15, 16, or 17 bits;

b. relocation disabling;

c. user IOT enabling;

d. write protection of the shared segment, and

e. specifying the shared segment length.

M7174 Instruction Prefetch (IPF)

The M7174 IPF provides the XVM System with improved instruction fetch times by prefetching presumed instructions from memory. IPF does this by monitoring requests to memory and synchronizing itself to the current instruction address. The IPF then attemps to prefetch up to four locations ahead of the processor. Simultaneously, the IPF continues to monitor memory references and, whenever possible, provides the requested instructions directly from its internal register file. Provisions to pause during operand and/or defer cycles to minimize memory conflicts are also provided by the IPF. Whenever the IPF fails to supply the requested instruction, or if it senses that the current instruction will cause the program to break sequence, the IPF will abort the current contents of its register file. The IPF may be enabled and disabled under program control or manually by means of a switch on the M7172 Bus Interface module.

M7173 Memory Port

The M7173 Memory Port arbitrates requests for memory access directly from the XVM, IPF, and the external processor input. M7173 drives, receives, and de-skews the XM15 memory bus. On the external processor input, M7173 has upper and lower limit address selection, negative address relocation (XV200 Unichannel systems), and "address float" which allows positive address relocation. The IPF and XVM inputs do not provide boundary or relocation selection. In addition, M7173 performs four way memory interleaving functions. XM15 may house an optional second memory port to allow greater flexibility in

	SIZE	CODE	NUMBER	REV
	A	SP	XM15-0-5	A

DEC FORM NO DEC 16-(381)-1022-N370
DRA 108

multi-processor configurations, memory interleaving and distribution, and improved IPF performance.

M7172 Bus Interface

The M7172 Bus Interface receives, drives, and de-skews the processor memory bus. M7172 converts processor address and control information to signals compatible to the XM15 and its memory bus and communicates with the memory port and IPF. Temporary storage for the current memory read data is also provided.

Internal Memory

The XM15 contains either 32K of MF15 core memory or 24K of ME15 core memory within the same BA11K mounting box.

1.2 SYSTEM INTERCONNECTIONS

XM15 Bus

The XM15 Bus is the bus between the memory port in the XM15 and the internal and external memory. If the optional second port is included in the XM15 there will be two independent XM15 buses.

The XM15 Bus connects all memory to the XM15. In addition, the XM15 Bus may be connected to the external processor input of another XVM System to form a multiprocessor system with two or more XVMs. Except for the absence of bus arbitration signals, the XM15 Bus is compatible with the Unibus.

CPU and IPU-to-Memory Bus (MDLs)

The central processor and I/O processor each asynchronously access memory over the same MDL bus. The priority structure concerning which processor's request is sent to the XM15 is determined by the processor memory port switch. The I/O processor is given first priority. The MDL bus consists of 18 bi-directional lines over which address and then data information is transmitted to and from the XM15. Various control signals are on this bus as well as provisions for interfacing the optional floating point processor (FP15).

IPU-to-I/O Devices (I/O Bus)

The I/O processor communicates with all devices over a common I/O Bus which contains bi-directional data lines, address lines, enable, request, and grant lines for API and data channel, and others such as program interrupt and skip request.

	SIZE	CODE	NUMBER	REV
	A	SP	XM15-0-5	A

DEC FORM NO DEC 16 (381)-1022-N370
DRA 108

Console-to-CPU (I Bus)

The indicator bus contains bi-directional lines to transmit information to the lights on the console and switch information from the console to the central processor. Several control lines are also located on the cable. The ME15/MF15 memory does not use the IBus.

API to Central Processor Bus

Because the XM15 contains several internal options which deal with the operation of the central processor, a special cable (API cable) is required so that the option may utilize these internal central processor signals.

2.0 SYSTEM SPECIFICATION

2.1 Physical Specification

The XM15 consists of a (13) thirteen slot hex backplane, an M7172, M7173, M7174, M7175 and M7176 module. In addition, there are several single height modules and interface cables. The backplane is mounted in a BA11K expander box. 32K of MF15 or 24K of ME15 memory may also reside in the BA11K. The XM15 is located below the console of the XV100 or in a standalone cabinet for add-ons.

2.2 Environmental Specification

Operating Temperature:	10^{o} - 50^{o} C input air
Humidity:	5 - 90% relative (noncondensing)
Input Voltage:	90-132 Vac, 115 Vac nominal 180-264 Vac, 230 Vac nominal
Frequency:	47-63 Hz, 3 phase cabinet power
XM15 Power Required: (does not include memory)	5 V ± 5% including ripple 25A max.

2.3 Unibus Specification

Standard Unibus rules must be followed concerning its length and loading when connecting to the external processor input (EPI). The EPI represents one bus load when the one port (M7173) configuration is used and two bus loads when the XM15 is dual ported.

3.0 Programming Specifications

3.1 IOTs

705512	RPL	Load PLs into AC.
705521	EBI	Enable breaks.
705522	DBI	Disable breaks.

3.2 Register Functions

Boundary Register

A ten bit register which when used in protect mode, sets the lower memory limit in increments of (400_8) for the users program. When in relocate mode the boundary register establishes the upper memory limit for the user program.

Relocation Register

A ten bit register which is added to the CPU address bits 0-9, when in user mode, creating the actual memory address. This register is not used in protect mode.

Clock Register

Contains the count of a free running oscillator which has a 10 usec resolution. The clock is disabled when API level 0-3 are being processed and is cleared after being read into the AC. Overflow is not prevented and will occur every 2.62 seconds.

IPOFF Register

A one bit register which is loaded with AC bit 17. When set the IPF is disabled until the bit is cleared by either the IOT IPOFF and AC bit 17 on a 0 or a CAF being issued.

Non-Existent Memory Flag

Set when non-existent memory is referenced while in user mode. Cleared by CAF, MPCNE or DBR.

Memory Protect Flag

Set if a privileged instruction is detected, an address boundary violation occurs, a non-existent memory reference occurs or a privileged write modification is attempted while in user mode.

Privileged instructions are the following =
(HLT, OAS, IOT, XCT of XCT, CAL).

User Mode

A one bit register which is set by the IOT MPEU and is cleared if the memory protect flag is set or an interrupt occurs. The bit can be restored by issuing a DBR IOT followed by an indirect memory reference. When User Mode is true, the memory management features which are selected, are turned on.

Memory Management (MM) Register

The MM register contains mode control bits, the Share Address Register (SR), and the Segment Length Register (SLR). The MM register is read to the AC by IOT 700032 and is loaded from the AC by IOT 700024. MM register bit assignment are shown in the following figure and are described in the following listing.

0	1 2	3	4	5	6 7	8 ◄——► 17
R DIS	G M	IP	WP	SH	SLR	SHARED ADDRESS

M7175 Memory Management (MM) Register Format

R DIS - Relocate Disable (Bit 0)

When set, inhibits relocation and all protect violations (except NEXM) while in User Mode. This allows the use of G Mode without the protection or relocation features. When bit 0 is clear, normal relocation and protection occur except as determined by Share Mode and IOT Enable.

GM - G Mode (Bits 1, 2)

The G Mode is entered whenever the system is in User Mode and the G0, G1 bits (MM bits 1 & 2) are set to binary 1, 2, or 3. The MM signals the CPU to pass 18 bits of any defer address and causes PC bits 0-2 to be stored during a JMS instruction rather than L, BM and UM. While in G Mode, G1, G1 select the address width through M7175.

G0, G1 = 00 - normal mode, not G Mode
= 01 - G Mode with 16 bit defers
= 02 - G Mode with 18 bit defers
= 03 - G Mode with 17 bit defers

G0, G1 bits also determine the virtual position of the Shared Address Space (SAS).

IP - IOT Permit (Bit 3)

Bit 3 of the MM, which when set, allows execution of IOTs while in User Mode.

WP - Write Protect (Bit 4)

Bit 4 of the MM, which when set, write protects the External Shared Address Space (ESAS). A protect violation and trap occurs if an ESAS write is attempted.

SH - Share (Bit 5)

Bit 5 of the MM enables Share Mode when set.

SLR - Segment Length Register (Bits 6, 7)

These bits determine the size of the external shared segments. Always equals ISAS + ESAS.

Bits 6, 7 = 0 = 1000_8 (512_{10}) Locations

= 1 = 2000_8 (1024_{10}) Locations

= 2 = 10000_8 (4K) Locations

= 3 = 20000_8 (8K) Locations

Shared Address Register - SA (Bits 8 - 17)

The Shared Address Register (bits 8 - 17 of the MM) contains the relocation factor for the share address. It points to the position of ESAS - 256 in core. SA bits 8-17 are added to the CPU address bits 5-9.

NOTES:

If the external processor bus does not continue from the XM15 it will be terminated in XM15 slot A/B10 with a M930 module. BUS DC LO will be grounded if no EXT PROC.

The memory bus is terminated at the last memory by an M930 in slot A/B09.

Memory on the processor rear door should be positioned last on the XM15 bus eliminating the necessity of exiting the rear door with the XM15 bus for ease of cabling and minimizing bus length.

XM15 bus #2 follows the same rules as bus #1 when present.

5.0 MAINTENANCE

5.1 Equipment

The following equipment is helpful in troubleshooting problems in the XM15.

Tektronix 453 oscilloscope or equivalent
Extender boards

5.2 The XM15 has no mechanical parts requiring regular service. Therefore, only standard processor maintenance procedures are necessary to insure reliable operation.

5.3 Refer to Chapter 7 of the Maintenance Manual for adjustments.

SCOPE

The following steps will be followed to accept and insure that all necessary paper work, diagnostics, etc., are included with the XM15.

HARDWARE AND SOFTWARE

Reference prints A-PL-XM15-0-8 for necessary hardware and software.

PROCEDURE

1. Visually inspect for loose bolts, power plugs, modules, pinched cables or bent pins.
2. Check that all fans are working properly.
3. Check that all console functions work correctly.
4. Load and run all diagnostics. Appendix I shows diagnostics and run times. The IPF (M7174) should be "ON".
5. Load and run system exerciser.
6. If operating system supplied; one pass of the O. S. acceptance test.
7. When all diagnostics have been run, acceptance of the XM15 system is complete.

APPENDIX I

All diagnostics must run error free.

Program	Run Time
Extended Memory Address Test	2 Passes/Bank
Extended Memory Checkerboard	2 Passes/Bank
Instruction Test Pt. 1	10 Min.
Instruction Test Pt. 1A	10 Min.
Instruction Test Pt. 2	10 Min.
I/O Test (API)	15 Min.
Memory Protect Test	2 Passes
Memory Relocate Test	2 Passes
XM15 Memory Management Test	1 Pass
