ABOUT THIS GUIDE

- Purpose We've designed this <u>Z80 Programmer's Guide</u> to provide the information you need to know in order to write application software to run on Z80-based microcomputers under the TurboDOS operating system. This document explains the theory of operation of each internal facility of TurboDOS. It also describes in detail each TurboDOS function that may be called by an application program.
- Assumptions In writing this guide, we've assumed that you are an experienced assembly-language programmer writing application programs for the 280 TurboDOS environment. We've also assumed you have read the <u>TurboDOS 1.3 User's Guide</u>, and are therefore familiar with the commands and external features of TurboDOS.
- Organization This guide starts with a section that describes the fundamentals of the TurboDOS environment, with emphasis on the organization of memory and the interface and flow of control between application programs and the operating system.

The next two sections explain TurboDOS internals in more detail. One describes the file system, and the other describes serial I/O.

There are two reference sections that explain each TurboDOS function call in detail. One section describes CP/M-compatible functions supported by TurboDOS, while the other describes functions unique to TurboDOS.

Appendices describe a debugging tool called MONITOR, and summarize the function calls in condensed tabular form. Finally, there is an alphabetical index.

FUNDAMENTALS This section introduces you to the TurboDOS environment. Emphasis is given to the organization of memory, and to the interface and flow of control between application programs and the operating system. Subsequent sections describe the file system and other facilities in detail.

Memory Organization The resident portion of TurboDOS typically occupies between 12K and 24K of memory, depending on configuration. An additional 2K to 8K (or more) may be devoted to disk buffers, and another 1K or so to print queues, file interlocks, and various other items of dynamic working storage. A 256-byte "Base Page" is reserved at the bottom of memory for communications between TurboDOS and application programs. The remaining memory space available for use by commands and application programs is known as the "Transient Program Area" (TPA).

> 280 TurboDOS supports two alternative memory organization schemes, depending on whether or not bank-switched memory is available.

TurboDOS 1.3 Z80 Programmer's Guide

Memory Organization (Continued)

Non-Banked Memory A non-banked Z80 configuration is limited by hardware constraints to a maximum of 64K of memory. TurboDOS resides in the topmost portion of memory, and allocates its disk buffers and other dynamic space requirements immediately below itself. The TPA occupies the lower portion of memory:

In non-banked systems, the TPA is limited by the size of TurboDOS, its disk buffers, and other dynamic space. If more TPA is needed, the size of the disk buffer area may be decreased using the BUFFERS command or a system call. However, this works only when the system is quiescent (no files open, no print jobs queued, etc.) so that there is no dynamic space allocated below the disk buffers.

Memory Organization (Continued)

Banked Memory A banked 280 configuration permits more than 64K of memory by providing two memory banks, only one of which may be active at a time. TurboDOS resides in bank 0 along with its disk buffers and other dynamic space, while a 63K Transient Program Area occupies bank 1.

> An area of common (non-switched) memory must be provided at the top of memory. Ideally, it should be 1K, permitting each memory bank to be 63K. However, hardware design often dictates that the common area be larger, often as big as 16K. A large common area reduces the memory available for TurboDOS, but does not reduce the TPA size:

TurboDOS 1.3 Z80 Programmer's Guide

Program Interface

Program Interface TurboDOS supports 94 different functions that may be invoked by an application program. Functions are provided for file management, console input/output, printing and spooling, The and various other TurboDOS facilities. last half of this quide is largely devoted to describing each of these functions in detail. Functions supported by TurboDOS fall into two categories: CP/M-compatible functions, and TurboDOS-unique functions. We will refer to them as "C-functions" and "T-functions", respectively. TurboDOS supports 50 C-functions and 44 T-Functions. To invoke a C-function, a program executes a C-Functions CALL to location 0005H in the Base Page with a function number in the C-register. Turbo-DOS supports all BDOS functions of CP/M 2.2: 20 Read Sequential 0 System Reset 21 Write Sequential l Console Input 2 Console Output 22 Make File 3*Raw Console Input 23 Rename File 4*Raw Console Output 24 Return Login Vector 5 List Output 25 Return Current Disk 6 Direct Console I/O 26 Set DMA Address 7 Get I/O Byte 27*Get ALV Address 8 Set I/O Byte 9 Print String 28 Write Protect Disk 29 Get R/O Vector 10 Read Cons. Buffer 30 Set File Attributes 11 Get Console Status 31 Get DPB Address 32 Get/Set User Number 12 Return Version 13 Reset Disk System 33 Read Random 14 Select Disk 34 Write Random 15 Open File 16 Close File 35 Compute File Size 36 Set Random Record 17 Search for First 37 Reset Drive 18 Search for Next (38-39 reserved) 40*Write Random 0-Fill 19 Delete File

Program Interface (Continued)

C-Functions (Continued)	These TurboDOS C-functions are compatible with the corresponding functions in CP/M 2.2 except for the four functions marked with an asterisk above. In TurboDOS, C-functions 3 (Raw Console Input) and 4 (Raw Console Out- put) are compatible with MP/M II rather than CP/M. C-function 40 (Write Random with Zero Fill) is synonymous with 34 (Write Random). C-function 27 (Get ALV Address) performs no operation in TurboDOS, but this function affects only the STAT utility of CP/M which is not normally used with TurboDOS.
	In addition to BDOS functions 0-40 supported by CP/M 2.2, a number of additional functions have been implemented in CP/M 3 and MP/M II. TurboDOS provides compatible C-functions for certain of these functions:
	42 Lock Record107 Return Serial No.43 Unlock Record108 Get/Set Rtn Code46 Get Free Space110 Get/Set Delimiter47 Chain to Program111 Print Block104 Set Date/Time112 List Block105 Get Date/Time152 Parse Filename
	However, the following rarely-used CP/M 3 and MP/M II functions are <u>not</u> implemented, and perform no function in TurboDOS:
	41 Test and Write98 Free Blocks44 Set Multi-Sector99 Truncate File45 Set Error Mode100 Set Dir Label48 Flush Buffers101 Get Dir Label49 Get/Set SCB102 Read PW Mode50 Direct BIOS Call103 Write File XFCB59 Load Overlay106 Set Default PW60 Call RSX109 Get/Set Cons Mode

FUNDAMENTALS

Program Interface (Continued)

T-Functions	To invoke a T-function, a program executes a CALL to location 0050H in the Base Page with a function number in the C-register. A dif- ferent entrypoint address is used to avoid conflict with C-function number assignments. TurboDOS supports the following T-functions:
	0 Reset O/S 22 Phys Disk Access
	1 Create Process 23 Set Buffer Parms
	2 Delay Process 24 Get Buffer Parms
	3 Allocate Memory 25 Lock/Unlock Drive
	4 Deallocate Memory 26 Flush/Free Buffers
	5 Send Message 27 Get/Set Print Mode
	6 Receive Message 28 Sig End-of-Print
	7 Set Error Address 29 Get/Set Despl Mode
	8 Set Abort Address 30 Queue a Print File
	9 Set Date/Time 31 Flush List Buffer
	10 Get Date/Time 32 Network List Out
	11 Rebuild Disk Map 33 Remote Console I/O
	12 Get TurboDOS S/N 34 Get Comm Status
	13 Set Compat. Flags 35 Comm Input
	14 Log-On/Log-Off 36 Comm Output
	15 Load File 37 Set Comm Baud Rate
	16 ACTIVATE DO-FILE 38 Get Comm Baud Rate
	1/ Autoload On/Off 39 Set Modem Controls
	18 Send Command Line 40 Get Modem Status
	19 Get Alloc Info 41 User-Defined Func.
	20 Get Phys Disk Info 42 Reorg Disk Directory 21 Get/Set Drv Status 43 Select Mem. Bank
Termination	A program may terminate by jumping to loca- tion 0000H in the Base Page, or by invoking C-function 0 (System Reset). Both methods are entirely equivalent, and cause TurboDOS to terminate the program in TPA and prompt for the next command. A program may also terminate by invoking C-function 47 (Chain to Program), which allows the program to specify the next command to be executed after the program terminates.

TurboDOS 1.3 280 Programmer's Guide

> Program Interface (Continued)

BIOS Branch Table For compatibility with CP/M, TurboDOS provides a full simulated "BIOS Branch Table" to support applications that make direct BIOS calls. The branch table is compatible with CP/M 2.2, and it always begins on a page boundary (multiple of 0100H) as in CP/M.

Offset	Function
	and a second and a second s
base+0	cold start
base+3	warm start
base+6	console status to A-reg
base+9	console input to A-reg
base+12	console output from C-reg
base+15	printer output from C-reg
base+18	raw console output from C-reg
base+21	raw console input to A-reg
base+24	home drive to track zero
base+27	select drive from C-reg
base+30	set track from BC-reg
base+33	set sector from BC-reg
base+36	set DMA address from BC-reg
base+39	read disk sector
base+42	write disk sector
base+45	list status to A-reg
base+48	sector translate from BC to HL

Base Page location 0000H contains a JMP instruction to the second (warm start) entrypoint of the branch table. Thus, a program can always determine the base address of the branch table by obtaining the address found at Base Page location 0001H and subtracting 3 from it.

Command Processing

Command ProcessingA TurboDOS command always identifies a program file residing on disk, and causes that program to be loaded into memory (TPA) and executed. TurboDOS has no "built-in" commands.TurboDOS comes with more than 30 standard command programs (described in detail in the User's Guide). You can expand the vocabulary of commands simply by storing additional programs on disk. Programs are usually kept in .COM files.Command PromptTurboDOS displays a command prompt on the

- Command Prompt TurboDOS displays a command prompt on the console whenever it is ready to accept a command. The command prompt is composed of the current user number, the current drive letter, and the } prompt symbol.
- Command Format Each TurboDOS command consists of the file name of the program to be executed, possibly followed by an optional command tail of up to 127 characters. A command may be entered in upper- or lower-case letters, but is converted to upper-case by TurboDOS.

The program name may have an explicit file type, but usually doesn't (TurboDOS assumes .COM). It may also have an explicit drive specification (like "B:") if the program is not on the current drive. You will get an error message if the program file cannot be found on disk, or if the available TPA is not big enough to hold the program.

A special kind of command is used to change the current drive. It consists of a drive specification (like "B:") with no program name.

TurboDOS 1.3 280 Programmer's Guide

> Command Processing (Continued)

Tail Parsing The format of a command tail is determined by the particular program involved. TurboDOS passes the command tail to the program by saving the length of the tail (in characters) at location 0080H of the Base Page, and saving the text of the tail (up to 126 characters) starting at location 0081H. TurboDOS also stores a null (zero byte) immediately following the last character of the command tail. The tail includes all characters following the program name, including leading spaces. If no tail is given in the command, the length stored at 0080H is zero. If the command tail consists of one or two filenames of the form:

{d:}filename{.typ}

then TurboDOS parses each into File Control Block (FCB) format. The first parsed FCB is saved at location 005CH of the Base Page, and the second parsed FCB is saved at location 006CH. Parsing is done following the procedure described for C-function 152 (Parse Filename).

Command Strings TurboDOS also accepts strings of commands separated by the character \ (backslant). TurboDOS executes each command in sequence, and re-displays each but the first as it is executed. A command string may not exceed the size of the command buffer, which is normally big enough to accomodate two lines of text.

TurboDOS 1.3 280 Programmer's Guide

Command Processing (Continued)

Batch Processing TurboDOS supports a batch processing mode in which execution is controlled by a predefined sequence of commands stored in a "dofile" on disk. A do-file is a text file (usually type .DO), each line of which contains a valid TurboDOS command or command string. A do-file may be activated with a DO command, or by invoking T-function 16 (Activate Do-File). A do-file may contain any number of embedded DO commands, and nesting is supported to any reasonable depth.

Automatic Loading TurboDOS provides a facility for loading any program or executing any command sequence automatically at initial start-up (cold start) or whenever a program terminates (warm start). Autoload at cold-start takes place only if a file named COLDSTRT.AUT is present on the start-up disk. Autoload at warm-start takes place only if a file named WARMSTRT.AUT is present on the current disk. The AUTOLOAD command is the usual way to create these .AUT files.

Alternatively, a program (.COM file) may be autoloaded by renaming it as COLDSTRT.AUT or WARMSTRT.AUT. In this case, however, the autoloaded program must not rely on the contents of the Base Page FCB (at 005CH) and buffer (at 0080H), because they will be left uninitialized by after the autoload.

TurboDOS 1.3 Z80 Programmer's Guide

Base Page Layout

Base Page Layout The Base Page is the 256-byte memory region from 0000H to 00FFH, and is used primarily for communication between TurboDOS and programs running in the TPA. The organization of the Base Page is shown below: Description Locations | 0000H-0002H Contains a JMP instruction to the warm-start entrypoint in the BIOS branch table. A program usually terminates by executing a JMP 0000H. The address at location 0001H can be used to locate the BIOS branch table. 0003H I/O byte, may be used to control device assignments in some implementations. 0004H Least-significant 4 bits contains current drive. Most-significant 4 bits contains current user number (modulo 15). 0005H-0007H Contains a JMP instruction to the TurboDOS C-function entrypoint. A program may invoke a C-function by executing a CALL 0005H with a C-function number in the C-register. The address at location 0006H is highest useable address in the TPA plus one, and may be used by a program to find out how much memory it can use.

FUNDAMENTALS

Base Page Layout (Continued)

Rase Page Lavout	Locations	Description
(Continued)		
	0008H-003AH	Reserved for interrupt vec- tors (RST 1 through 7).
	003BH-004FH	(Unused, reserved)
	0050H-0052H	Contains a JMP instruction to the TurboDOS T-function entrypoint. A program may invoke a T-function by exe- cuting a CALL 0050H with a T-function number in the C-register.
	0053H-005BH	(Unused, reserved)
	005CH-006BH	Default FCB part l. The first filename argument in a command tail is parsed into this 16-byte area.
	006СН-007ВН	Default FCB part 2. The second filename argument in a command tail is parsed into this 16-byte area, and must be moved to another location before making use of the default FCB.
<	007CH	Default FCB current record.
	007DH-007FH	Default FCB random record.
	0080H-00FFH	Default 128-byte buffer. This area receives the com- mand tail length in 0080H, and the command tail text (up to 126 characters plus a null terminator) in loca- tions 0081H-00FFH.

System Start-Up

System Start-Up To get TurboDOS started, it is necessary to read a copy of the operating system from disk into memory, a process known as "cold start". The exact cold-start procedure depends on the particular hardware involved.

Most TurboDOS implementations use this threestep cold-start procedure:

- 1. When the computer is turned on or reset, it executes the TurboDOS bootstrap from read-only memory (ROM). (In the HORIZON implementation, the bootstrap is loaded from reserved tracks on disk.) The bootstrap scans all disk drives from A to P, searching the directory of each ready drive for a file named OSLOAD.COM which contains the TurboDOS loader. When this file is found, the bootstrap loads it into the TPA and executes it.
- 2. The TurboDOS loader scans all disk drives from A to P, searching for a file named OSSERVER.SYS which contains the server operating system. When this file is found, the loader proceeds to load the operating system into the upper portion of memory, then transfers control to it. The drive from which the OSSERVER.SYS file was loaded becomes the "system disk".
- 3. The server downloads a user bootstrap routine into each user processor. The server then locates a file named OSUSER.SYS on the system disk which contains the user operating system, and downloads it into each user processor.

During network operation, it is helpful if the system disk is always on-line. If a fixed disk is available, it should be used as the system disk.

FUNDAMENTALS

Summary

Summary This section has introduced the fundamentals of the TurboDOS environment. You have learned how memory is organized in both nonbanked and banked systems. You understand the TurboDOS program interface, including Cfunctions, T-functions, and direct BIOS calls. You know how TurboDOS parses and processes commands, command strings, and dofiles, and how it communicates with programs via the Base Page.

Next, we examine the TurboDOS file system in considerable detail.

- FILE SYSTEM This section describes the TurboDOS file system in detail. It covers the structure of disks and files, the facilities provided to manage files, and the procedures for calling these facilities from application programs.
- Disk Capacity The TurboDOS file system can support up to sixteen logical drives per processor, identified by the letters A through P. Drives may be local to the processor, or may be attached to another processor and accessed by means of networking.

TurboDOS accomodates any combination of drives from mini-floppies to large hard disks in excess of a gigabyte. Allocation block size may be chosen individually for each drive, and affects maximum drive capacity as follows:

Alloc. Block Size	Max. Drive Capacity
1	
1K	256 Kilobytes
2K	128 Megabytes
4K	256 Megabytes
8K	512 Megabytes
16K	1,024 Megabytes
1	

Because these limits are so big, it is almost never necessary to partition a physical drive into smaller logical drives under TurboDOS. However, such partitioning is sometimes done for user convenience when using large fixed disks.

North Star TurboDOS recognizes four standard mini-floppy disk formats: double and quad density (35 track and 70 track) CP/M format, and double and quad density (non-interleaved) TurboDOS format. In addition, 80-track TurboDOS diskettes, although non-standard, can be handled on a read-only basis by the system.

Disk Organization

TurboDOS 1.3 280 Programmer's Guide

Disk Organization Each disk is organized into five areas: File Storage File Storage File Storage Allocation Map Volume Label

> Reserved tracks are required by certain hardware configurations to support cold-start, but are not otherwise used by TurboDOS. The volume label permits a name to be given to each disk. The allocation map contains one bit for each allocation block on the disk, and is used by TurboDOS to keep track of which disk blocks are occupied and which are free. The directory is a table of contents which identifies all files stored on the disk. The remainder of the disk (most of it) is available for file storage.

Reserved Tracks

CP/M does not maintain a volume label or allocation map on the disks it creates. When a CP/M disk is first accessed by TurboDOS, the first few CP/M directory entries are automatically relocated to the end of the directory in order to make room for the label and map. When a TurboDOS disk is accessed by CP/M, the label and map appear to be ordinary deleted directory entries. Thus, disks can be moved freely between CP/M and TurboDOS in spite of the differences in organization.

FILE SYSTEM

Directory Formats	TurboDOS supports two alternative directory formats: linear and hashed. A flag bit in the directory label indicates which format is in use on a particular disk. The standard linear format is compatible with CP/M, and is searched sequentially. Conse- quently, look-up speed deteriorates with increasing directory size, and can get pain- fully slow on large disks with many files.
	The optional hashed directory format uses a hashing algorithm to make look-up in large directories much faster. A hashed directory may be used on any disk, but is especially suited for use on hard disks with many files. Hashed directories are <u>not</u> media-compatible with CP/M, but may be converted to linear format whenever exporting to CP/M is needed.
	Whether the directory is linear or hashed, searches involving "wild cards" have to be done linearly. Such wild-card searches are typically slower if the directory is hashed.
File Organization	A file contains a sequence of 128-byte records, and may be up to 134 megabytes (1,048,576 records) long. The records of a file may be read and written sequentially or randomly (by relative record number). A file may be extended by writing beyond the end of file. TurboDOS automatically allocates disk space when a file is extended, and deallo- cates it when a file is deleted.
	Text files are written as a sequence of ASCII characters with a carriage-return (ODH) and line-feed (OAH) at the end of each text line. Text lines are variable length and may span records. The end of a text file is marked by the ASCII character SUB (1AH).

FILE SYSTEM

File Operations

File Operations	About half of the 50 C-functions supported by TurboDOS are connected with the file system. These functions support the operations needed to manipulate files, directories, and disks.
	The following functions provide the basic facilities for sequential file access:
	C-Fcn Function Name
	15Open File16Close File20Read Sequential21Write Sequential22Make File

These additional functions are necessary to support random access and file sharing:

C-Fcn	Function Name
33	Read Random
34	Write Random
35	Compute File Size
36	Set Random Record
42	Lock Record
43	Unlock Record

Directory functions include:

C-Fcn	Function Name
1 17	Search for First
18	Search for Next
19	Delete File
23	Rename File
30	Set File Attributes

TurboDOS 1.3 Z80 Programmer's Guide

File Operations (Continued)

File Operations (Continued)	Drive-ori	lented functions are:
	C-Fcn	Function Name
	1	
	1 14	Select Disk
	24	Return Login Vector
	25	Return Current Disk
	1 28	Write Protect Disk
	29	Get R/O Vector
	31	Get DPB Address
	37	Reset Drive
	46	Get Free Space
	1	l
	Finally.	some other functions connected with
	the file	system include:
	<u>C-Fcn</u>	Function Name
	{	[
	13	Reset Disk System
	26	Set DMA Address
	32	Set/Get User Number
	47	Chain to Program
	152	Parse Filename

Each of these file system C-functions is described in detail later in this document.

FILE SYSTEM

Naming Files

Naming	Files	TurboDOS keeps track of files by name, main- taining a directory of files on each disk. A file is identified uniquely by four fields:
		 drive letter (A-P) user number (0-31) file name (up to 8 characters) file type (up to 3 characters)
		The drive letter specifies the disk on which the file is located. If no drive letter is given, the current drive is assumed by default.
		The user number specifies one of 32 logical file libraries on each disk. These libraries allow files to be conveniently segregated by user or application. Generally, user 0 is reserved for global files and user 31 is reserved for log-on security, leaving 1-30 for general use.
		The name and type fields are composed of ASCII characters. The file name may have up to eight characters, and the file type may have up to three. Shorter names and types are padded on the right with spaces.
		It is suggested that file names and file types be composed from the upper-case letters A-Z and the digits $0-9$. Actually, any ASCII characters may be used including lower-case letters, punctuation, and even non-printing control characters. However, such names may not be parsed correctly in commands nor dis- played correctly in directories.
		The question mark ? is a special wild-card character which may be used in file names and types to match any character in the corre- sponding position during directory searches.

FILE SYSTEM

Special File Names

Special File Names	TurboDOS gives special meaning to two reserved file names. "\$.DIR" refers to the directory area of a disk, while "\$.DSK refers to the entire contents of the physical disk volume (up to the maximum file size of 134 megabytes). These special files may be dumped, patched, or accessed like any ordin- ary file. However, access is restricted to privileged log-ons only.						
File Control Block	File-ori always Control FCB is a bytes for as follo	ented C-fur called wit Block (FCB a data str r random ac ws:	nctions and T-functions are th the address of a File) in the DE-register. The ucture 33 bytes long (36 ccess operations) organized				
	Offset	1 Field	Description				
	0	drive	drive code (0-16): 0 -> current drive 1 -> drive A 2 -> drive B : 16 -> drive P				
	1-8	name	file name in ASCII, padded on right with spaces, high-order bit of each byte reserved for attributes fl-f8				
	9-11	type	file type in ASCII, padded on right with spaces, high-order bit of each byte reserved for attributes t1-t3				
	12	extent	least significant five bits of extent number				

TurboDOS 1.3 Z80 Programmer's Guide

File Control Block (Continued)

File Control Block	Offset	Field	Description
(Continued)	13	spec1	flag byte (Do Not Use)
	14	spec2	most significant eight bits of extent number
	15	record count	number of records in current extent (0-128)
	16-31	map	allocation map of cur-
	32	current record	current record number (0-127) in current ex- tent
	33-35	random record	20-bit record number (byte 33 is least sig- nificant) for random- access operations

In general, the application program must initialize FCB bytes 0-12 before opening, making, or searching for a file. It must also zero FCB byte 32 before reading or writing a file sequentially from the beginning.

When a file is opened, TurboDOS fills FCB bytes 0-31 with information from the directory. Thereafter, the application program should not modify FCB bytes 0-31. When the file is closed, TurboDOS updates the directory with information from the FCB. A directory entry has the same structure as the first 32 bytes of an FCB. In a directory entry, however, byte 0 contains the user number 0-31 to which the file belongs, or the value 0E5H if the directory entry is not in use. Also, byte 13 may contain the exact byte count of the last record in the file.

TurboDOS 1.3 Z80 Programmer's Guide

File Attributes

File Attributes File attributes are stored in the high-order bits of the FCB name field bytes fl-f8 and type field bytes tl-t3, and are used to control how a file may be accessed:

Attribute	Definition
f1	FIFO file attribute
f2-f4	undefined file attributes
f5-f8	interface attributes
t1	read-only file attribute
t2	global file attribute
t3	archived attribute

The file attribute bits fl-f4 and tl-t3 are recorded in the directory, and may be set or cleared by means of C-function 30 (Set File Attributes). For a newly-created file, all attribute bits are initialized to zero. When a file is opened, its attributes are copied into the FCB. File attributes may also be interrogated by means of C-functions 17 and 18 (Search for First/Next).

The read-only attribute (tl) prevents a file from being written, deleted or renamed. The global attribute (t2) enables a file saved under user 0 to be accessed from any user number (it has no effect for files saved under non-zero user numbers). The archived attribute (t3) is used for incremental file backup, and is automatically cleared by TurboDOS whenever a file is written or renamed. The FIFO attribute (fl) causes a file to be accessed using a special "first-in first-out" access method (described later).

Attributes f2-f4 are undefined, and available to the user. Interface attribute bits f5-f8 cannot be used as file attributes; they specify options for certain C-functions.

FILE SYSTEM

User Numbers

User	Numbers	TurboDOS provides 32 file libraries on each disk corresponding to user numbers 0-31. Generally, user 0 is reserved for global files and user 31 is reserved for log-on security, leaving 1-30 for general use.					
		The current user number is established ini- tially at log-on. For a non-privileged log- on, the user number remains unchanged until log-off. This restricts file access to the corresponding file library (plus global files under user 0). For a privileged log-on, the user number may be changed without restric- tion by means of C-function 32 (Set/Get User Number).					
		The current user number is treated as a pre- fix to file names, thereby allowing each disk directory to contain up to 32 libraries. Most directory functions (make, rename, delete, search, etc.) are restricted to the library corresponding to the current user number. However, files in the user 0 library which have the global file attribute may be opened from any user number. This permits commands, programs, and other common files to be shared by all users.					
File	Sharing	In a multi-user TurboDOS system, it is pos- sible for multiple users to access the same file at the same time. This can happen if the users are logged-on to the same user number, or accessing the same global file. TurboDOS supports interlocks to regulate such file sharing at the file or record level.					
		TurboDOS file sharing facilities are compa- tible with MP/M, but provide significant extensions to alleviate the most serious deficiencies in MP/M file sharing.					

TurboDOS 1.3 Z80 Programmer's Guide

> File Sharing (Continued)

File Locks File-level interlocks are supported by means of four distinct modes of opening a file. The open mode is determined by FCB interface attributes f5-f6 when the file is opened or created. The four open modes are called exclusive, shared, read-only, and permissive.

> A file opened in <u>exclusive</u> mode is available to the opening process exclusively until it is closed, and may not be opened by any other process. A file cannot be opened in exclusive mode if the file is currently opened (in any mode) by another process.

> A file may be opened in <u>shared</u> mode by any number of processes simultaneously. All processes are allowed to read, write and extend the file. Record lock and unlock functions are honored only for file opened in shared mode.

> A file may be opened in <u>read-only</u> mode by any number of processes simultaneously. All processes are allowed to read the file, but not to write or extend it.

> A file may be opened in <u>permissive</u> mode by any number of processes simultaneously. All processes are allowed to read the file. If any process writes or extends the file, then that process gains an exclusive write-lock on the file, preventing any other process from writing to the file. The exclusive writelock is released when the locking process closes the file.

> In shared and permissive modes, if a process extends a file by adding new records at the end, these records become immediately accessible to other processes that also have the file open.

TurboDOS 1.3 Z80 Programmer's Guide

File Sharing (Continued)

Record Locks Record-level interlocks are controlled by means of explicit locking and unlocking requests made by the application program. This allows concurrent update by multiple processes.

> Record locks are by no means automatic, and require explicit cooperative participation by all updating programs. C-functions 42 (Lock Record) and 43 (Unlock Record) are honored only for files opened in the shared mode. Each program must lock a record before reading it, and must unlock the record after updating it.

> If a program attempts to lock a record that is already locked by another process, the Lock Record function returns an error code and the program must try again until it is successful. Alternatively, the program can ask TurboDOS to suspend program execution automatically until the lock request can be satisfied.

> To extend a shared file in a concurrent update environment, the extending program should first acquire a lock on record N+1 (where N is the last record in the file). The program may then safely write record N+1, and finally unlock N+1.

TurboDOS 1.3 280 Programmer's Guide

> File Sharing (Continued)

Compatibility Modes The file sharing facilities of TurboDOS are designed to provide compatibility with MP/M, yet at the same time to alleviate the most serious limitations of MP/M file sharing. TurboDOS may be instructed to adhere strictly to MP/M file-sharing rules, or alternatively to relax some of these rules. To this end, TurboDOS provides a byte of "compatibility flags" with the following bit assignments:

Bit F1	ag Name	Affects
7 per 6 sus 5 glo 4 mix 3 log 2-0 (no	missive pend bal-write ed-mode ical t defined)	default open mode lock conflict action writing global files mixed file open modes record lock validity

For each compatibility flag, a zero-bit denotes strict adherence to the MP/M rule, while a one-bit signifies a relaxation of that rule. The initial setting of the compatibility flags may be established during TurboDOS system generation by assigning the desired value to the symbolic location COMPAT. A program may modify its compatibility flags by calling T-function 13 (Set Compatibility Flags), but the flags automatically revert to their initial setting when the program terminates.

If the <u>permissive</u> flag (bit 7) is set, the default file open mode is permissive, rather than exclusive (as in MP/M). Specifically, the open mode is determined when a file is opened or created by FCB interface attributes f5-f6, as shown in the following table:

TurboDOS 1.3 Z80 Programmer's Guide

File Sharing (Continued)

Compatibility Modes (Continued)	pe f	rmi 6 f	ssi 5	ve flag = 0 open mode	perm f6	iss f5	ive flag = 1 open mode	1
		0 0 1 1	0 1 0 1	exclusive shared read-only permissive	0 0 1 1	0 1 0 1	permissive shared read-only exclusive	

If the <u>suspend</u> flag (bit 6) is set, then an attempt to lock a record that is already locked by someone else causes the process to be suspended until its lock request can be satisfied. Otherwise, an attempt to lock or write to a record that is already locked by someone else results in an immediate error return code (as in MP/M).

If the <u>global-write</u> flag (bit 5) is set, then a program running under a non-zero user number may both read and write global files. Otherwise, access to global files is strictly read-only (as in MP/M).

If the <u>mixed-mode</u> flag (bit 4) is set, then one process may open a file in shared mode while another has it open in read-only mode (or vice-versa). Otherwise, the shared and read-only modes are mutually exclusive (as in MP/M).

If the <u>logical</u> flag (bit 3) is set, then the FCB random record field for C-functions 42 and 43 (Lock/Unlock Record) is interpreted as an arbitrary 24-bit logical record number which is not validated and does not cause file positioning. Otherwise, the FCB random record field for C-functions 42 and 43 is interpreted as the relative number of a 128byte record, and causes the file to be positioned to that record (as in MP/M).

FIFO Files

FIFO Files To facilitate communications between processes, processors and users, TurboDOS supports a special kind of file called a FIFO (firstin, first-out) similar in concept to a Unix pipe. FIFOs are opened, closed, read and written exactly like ordinary sequential files. However, a record written to a FIFO is always appended to the end, and a record read from a FIFO is always taken from the beginning and removed from the FIFO. A FIFO is differentiated from other files by the presence of the FIFO attribute (fl) in the directory. Record zero of a FIFO is a header record used by TurboDOS to keep track of the FIFO, and is organized as follows: Offset | Contents n type (0=RAM, -l=disk) mode (0=error code, -1=suspend) 1 maximum size (records) 2-3 4-5 current size (records) number of last record read 6-7 number of last record written 8-9 10-127 (not used, reserved)

The header specifies whether the body of the FIFO is RAM- or disk-resident, and the maximum number of records it may contain. RAMresident FIFOs provide high-speed but limited capacity (up to 127 records, usually much less). Disk-resident FIFOs provide large capacity (up to 65,535 records) but slower speed. The FIFO command may be used to create a FIFO and initialize its header.
FILE SYSTEM

FIFO Files (Continued)

FIFO Files (Continued)	Normally, reading from an empty FIFO returns an end-of-file code (A=1), and writing to a full FIFO returns a disk-full code (A=2). However, if the mode byte in the FIFO header is set to -1 (suspend), then reading from an empty FIFO or writing to a full FIFO causes the process to be suspended until the FIFO becomes non-empty or non-full.
	The header or disk-resident body of a FIFO may be accessed directly using C-functions 33 and 34 (Read/Write Random), thereby bypassing the normal first-in first-out protocol. An attempt to make (C-function 22) an existing FIFO is treated as an open (C-function 15), while an attempt to delete (C-function 19) a FIFO is ignored. The only way to get rid of a FIFO is first to clear the FIFO attribute, then delete it.
Load Optimization	TurboDOS contains a program load optimizer which greatly improves the speed of program loading and overlay fetching from local disk drives. This module scans the allocation map of program files to be loaded into TPA, de- tects sequentially-allocated file segments (often 16K or more), and loads these segments at the maximum transfer rate of the disk controller. This provides a manyfold in- crease over normal sequential file access performed one 128-byte record at a time.
	The program load optimizer is utilized auto- matically by the command line interpreter and the autoload processor, and is also acces- sible to user programs by means of T-function 15 (Load File). The optimizer is not invoked when loading from a remote drive over the network, nor when loading into a banked TPA.

FILE SYSTEM

Buffer Management

Buffer Management The TurboDOS buffer manager performs multilevel buffering of physical disk input/output, using least-recently-used (LRU) buffer assignment and other sophisticated optimizations. Buffering provides a manyfold reduction in the number of physical disk accesses during both sequential and random file operations.

> The number and/or size of disk buffers may be changed by means of T-function 23 (Set Buffer Parameters), and interrogated by T-function 24 (Get Buffer Parameters). The number of buffers must be at least two, and the buffer size must be at least as large as the physical sector size of the disks being used. For optimum performance, the number of buffers should be as large as possible consistent with the TPA size required.

> The buffer manager maintains its buffers on two lists: the "in-use" list and the "free" list. Whenever the file manager requests a disk access, the buffer manager first checks the in-use list to see if the requested disk sector is already in a buffer. Most of the time it is, and no physical disk access is required. If not, the buffer manager attempts to acquire a new buffer from the free list. If the free list is empty, the leastrecently-used buffer (at the end of the inuse list) is written out to disk if necessary, and then reused to receive the newly requested disk sector.

FILE SYSTEM

Media Changes

Media Changes	Before a removable disk volume is changed, it is crucial that any buffers relating to that disk are written out if necessary, and re- turned to the free list. In single-user configurations of TurboDOS, this is done automatically whenever the system pauses for console input. In multi-user configurations, buffers must be explicitly flushed and freed by calling T-function 26 (Flush/Free Buffers) prior to changing disks. This is most com- monly done by executing the CHANGE command, but should also be coded into applications that require media changes during operation. For safety, TurboDOS also flushes buffers automatically during any lull in system acti- vity, and frees them automatically whenever a disk drive becomes not-ready.
Error Handling	In the event of an unrecoverable disk error, TurboDOS normally displays a diagnostic mes- sage in one of these formats: Read Error, Drive A, Track 0, Sector 2 [Retry, Ignore, Abort] Write Error, Drive B, Track 5, Sector 16 [Retry, Ignore, Abort] Not Ready Error, Drive C [Retry, Abort] Spooler Error [Ignore, Abort] and waits for the user to choose the desired recovery option by keying in the appropriate

FILE SYSTEM

Error Handling (Continued)

Error Handling (Continued) An application program may elect to intercept and process such errors, however, by calling T-function 7 (Set Error Address). In this case, TurboDOS does not display its usual diagnostic messages. Normal error processing resumes automatically when the application program terminates.

> NOTE: Because the buffer manager optimizes disk write operations by deferring them as long as possible, write errors may be reported later than expected and possibly even to a different user than expected.

> > 2-19

- SERIAL I/O This section describes the TurboDOS facilities that deal with serial input/output (I/O) in connection with consoles, printers, and communications channels.
- Console I/O TurboDOS provides ten C-functions that permit programs to interact with the user console device. Three kinds of console input/output are supported in TurboDOS: basic I/O, raw I/O, and string I/O.
- Basic Console I/O Three C-functions provide basic console I/O on a single-character basis:

C-Fcn	Function Name
1	Console Input
2	Console Output
11	Get Console Status

The Console Input function waits for a character to be keyed in, echoes the character to the console screen to provide visual confirmation, and returns the character to the calling program.

The Console Output function displays a character on the console screen. It expands horizontal tab characters into spaces, based upon tab stops at every eighth column.

The Get Console Status function checks to see whether or not a console input character is available, and returns a Boolean result.

SERIAL INPUT/OUTPUT

Console I/O (Continued)

Raw Console I/O Three additional C-functions provide raw console I/O: C-Fcn | Function Name 3 Raw Console Input 4 Raw Console Output Direct Console I/O 6 The Raw Console Input function is similar to the basic Console Input function, except that input characters are not echoed to the screen. Likewise, the Raw Console Output function is like the basic Console Output function, except that horizontal tabs are not expanded. The Direct Console I/O function combines the functions of Raw Console Input, Raw Console Output, and Console Status. It is supported only for compatibility with CP/M. String Console I/O The remaining console I/O functions provide input and output of character strings: C-Fcn | Function Name 9 Print String 10 Read Console Buffer 110 Get/Set Delimiter 111 Print Block The Print String function outputs a string of characters to the console. The string may be of any length, and is terminated by a reserved delimiter. The delimiter is normally the dollar-sign \$ character, but may be

function.

changed by means of the Get/Set Delimiter

SERIAL INPUT/OUTPUT

TurboDOS 1.3 280 Programmer's Guide

> Console I/O (Continued)

String Console I/O The Print Block function is similar to Print (Continued) String, except that the string length is passed explicitly so that no delimiter is needed. Both Print String and Print Block expand horizontal tabs.

> The Read Console Buffer function reads an entire line of edited input from the console. Characters are accepted from the console and stored in successive memory locations until a carriage-return terminates the line. Input characters are echoed to console output (but, unlike CP/M, tabs are not expanded). Rudimentary editing is supported: backspace or delete characters erase the last typed character, while CTRL-U or CTRL-X erase the entire line.

Attention Requests The execution of a program or do-file may be suspended at any time by typing a reserved "attention" character on the console keyboard. In North Star TurboDOS, this is BREAK. TurboDOS will "beep" to acknowledge that it has received the attention request.

> After an attention request, the interrupted program or do-file will remain suspended until one of the following attention responses is typed:

> CTRL-Q (resume) simply restarts execution at the point of interruption.

CTRL-C (abort) cancels execution of the interrupted program or do-file, causes any nested commands and do-files to be disregarded, and returns to the command prompt. An application program may elect to intercept such abort requests, however, by calling Tfunction 8 (Set Abort Address).

SERIAL INPUT/OUTPUT

Console I/O (Continued)

Attention Requests CTRL-P (echo-print) restarts execution and (Continued) causes all subsequent console output also to be echoed to the printer. A second attention/echo sequence turns off echoing of console output to the printer. CTRL-L (end-print) restarts execution after signalling the end of the current print job. Comm Channel I/O In order to allow communications-oriented applications programs to be written in a hardware-independent fashion, TurboDOS supports a standard communications channel interface consisting of seven T-functions: T-Fcn | Function Name Get Comm Channel Status 34 35 Comm Channel Input Comm Channel Output 36 37 Set Comm Channel Baud Rate 38 Get Comm Channel Baud Rate 39 Set Comm Channel Modem Controls Get Comm Channel Modem Status 40 These functions support multiple channels of communications. T-functions 34-36 provide basic single-character comm channel I/O (analogous to raw console I/O). T-functions 37-38 allow programs to sense or set the comm channel baud rate to any standard speed from 50 to 19,200 baud. T-functions 39-40 allow programs to set modem control signals (RTS, DTR) and to sense modem status signals (CTS,

DSR, DCD, RI).

SERIAL INPUT/OUTPUT

Printer Output

TurboDOS provides the basic printing func-Printer Output tions of CP/M, plus an elaborate concurrent printing facility which offers several modes of print spooling and flexible print routing among multiple printers and print queues. The spooling and routing facilities are completely transparent to application programs. Two C-functions provide the basic means for Basic Printing programs to generate printer output: C-Fcn | Function Name 5 List Output 112 List Block The List Output function outputs a single character to be printed, while the List Block function outputs a character string of specified length. In contrast to console I/O, these print output functions do not expand tabs. Control Functions Four T-functions provide control over the print spooling, de-spooling, and queuing mechanisms of TurboDOS: T-Fcn Function Name 27 Get/Set Print Mode

28 Signal End-of-Print 29 Get/Set De-Spool Mode 30 Queue a Print File

The Get/Set Print Mode function controls print routing. Print output may be routed direct to a specified printer, spooled to a specified drive and print queue, displayed on the console, or simply discarded.

SERIAL INPUT/OUTPUT

Printer Output (Continued)

Control Functions (Continued) The Signal End-of-Print function allows a program to terminate a print job explicitly. In the absence of this function, a print job ends automatically at the conclusion of the program, upon receipt of an end-print attention request from the console, or when a reserved end-of-print character (if defined) appears in the print output stream.

The Get/Set De-Spool Mode function controls background printing (de-spooling). A printer may be assigned to de-spool from a specified queue, or may be placed in an off-line status. Any print job in process may be stopped, resumed, restarted from the beginning, or terminated altogether.

The Queue a Print File function permits a program to queue a print file (or any text file, for that matter) for background printing. The file may be placed on any specified print queue, and may be saved or deleted automatically after printing.

C-FUNCTIONS

This section describes the 50 CP/M-compatible functions ("C-functions") supported by Turbo-DOS. The C-functions are presented in numerical order, with calling parameters, return value, and a detailed explanation for each.

To invoke a C-function, a program executes a CALL to location 0005H in the Base Page with a function number in register C. Byte-length arguments are passed in register E, and wordlength arguments in register DE. C-functions return byte-length values in register A (duplicated in L), or word-length values in register HL (duplicated in BA).

If a C-function call is made with register C set to an unsupported function number, Turbo-DOS returns immediately with registers HL and BA zeroed.

C-function calls generally destroy registers A-B-C-D-E-H-L, but preserve X, Y, and the alternate register set.

C-FUNCTIONS

C-Function 0 System Reset

C-Function 0	System Reset
Entry Arguments	Reg Description C = 0
Explanation	The System Reset function terminates the calling program ("warm-start"). Program termination is more commonly performed by executing a jump to location 0000H, which has exactly the same effect.
	In a multi-user TurboDOS system, program termination closes any open files, releases any locked records or devices, and ends any active print job.

TurboDOS 1.3 280 Programmer's Guide

.

C-Function 1 Console Input

C-Function 1	Console Input
Entry Arguments	Reg Description C = 1
Returned Value	Reg Description A = input character
Explanation	The Console Input function obtains the next character from the console keyboard, and returns it in register A. If no character is available, the calling program is suspended until a character is typed.
	Graphic characters and certain control char- acters (carriage-return, line-feed, and back- space) are echoed to the console screen. Horizontal tabs are expanded into multiple spaces, based upon tab stops at every eighth column.

TurboDOS 1.3 Z80 Programmer's Guide

C-Function 2 Console Output

C-Function 2	Console Output
Entry Arguments	Reg Description
	C = 2 E = output character
Explanation	The Console Output function displays the character passed in register E on the console screen. Horizontal tabs are expanded into multiple spaces, based upon tab stops at every eighth column.

C-FUNCTIONS

C-Function 3 Raw Console Input

C-Function 3	Raw Console Input
Entry Arguments	Reg Description
Returned Value	Reg Description A = input character I
Explanation	The Raw Console Input function obtains the next character from the console keyboard, and returns it in register A. If no character is available, the calling program is suspended until a character is typed. Input characters are not echoed to the console screen. This function is compatible with MP/M. (In CP/M 2.2, this function is Input from Reader Device. In CP/M 3, this function is Auxil- iary Input.)

TurboDOS 1.3 280 Programmer's Guide

C-Function 4 Raw Console Output

C-Function 4	Raw Console Output
Entry Arguments	Reg Description C = 4 E = output character
Explanation	The Raw Console Output function displays the character passed in register E on the console screen. Horizontal tabs are not expanded.
	This function is compatible with MP/M. (In CP/M 2.2, this function is Output to Punch Device. In CP/M 3, this function is Auxil- iary Output.)

C-FUNCTIONS

C-Function 5 List Output

C-Function 5	List Output	
Entry Arguments	Reg Description	
	C = 5 E = output character	

Explanation The List Output function sends the character passed in register E to be printed according to the current print routing. Horizontal tabs are not expanded.

1

4-7

TurboDOS 1.3 Z80 Programmer's Guide

C-Function 6 Direct Console I/O

C-Function 6	Direct Console I/O
Entry Arguments	Reg Description
	C = 6 E = -1 (for combined status/input) -2 (for status) -3 (for raw input) output character (for raw output)
Returned Value	Reg Description
	A = input character or status
Explanation	The Direct Console I/O function performs one of four possible sub-functions, depending upon the argument passed in register E. If $E = -1$ (OFFH), then any available console input character is returned in register A, without echo to the screen. If no character is available, the function returns $A = 0$.
	If $E = -2$ (OFEH), then this function returns console status (A = 0 if no console input is available, or A = -1 otherwise). Equivalent to C-function 11 (Get Console Status).
	If $E = -3$ (OFDH), then this function obtains the next console input character and returns it in register A, without echo to the screen. If no character is available, the calling program is suspended until a character is typed. Equivalent to C-function 3 (Raw Con- sole Input).
	For other values of E, this function displays the character on the console screen. Hori- zontal tabs are not expanded. Equivalent to C-function 4 (Raw Console Output).

C-FUNCTIONS

C-Function 7 Get I/O Byte

C-Function 7	Get I/O Byte
Entry Arguments	Reg Description
	C = 7
Returned Value	Reg Description
	A = contents of I/O byte (loc 0003H)
Explanation	This function simply returns the value of Base Page location 0003H (which is used in some implementations to control serial I/O device assignment).
	NOTE: This function is supported only if the optional module CPMSUP is included during TurboDOS system generation.

C-FUNCTIONS

C-Function 8 Set I/O Byte

C-Function 8	Set I/O Byte
Entry Arguments	Reg 1 Description C = 7 E = new value of I/O byte (loc 0003H)
Explanation	This function simply sets the value of Base Page location 0003H (which is used in some implementations to control serial I/O device assignment).
	NOTE: This function is supported only if the optional module CPMSUP is included during TurboDOS system generation.

TurboDOS 1.3 Z80 Programmer's Guide

> C-Function 9 Print String

C-Function 9 Print String

Entry Arguments

Re	g	1		Description	1
			•		ļ
	: \ F	=	9 string	addrogg	1
I				auuress	Ì

Explanation The Print String function displays a string of characters on the console screen. The string may be of any length, and is terminated by a reserved delimiter. The delimiter is normally the dollar-sign \$ character, but may be changed by means of C-function 110 (Get/Set Output Delimiter). Horizontal tabs are expanded into multiple spaces, based upon tab stops at every eighth column.

TurboDOS 1.3 Z80 Programmer's Guide

C-Function 10 Read Console Buffer

C-Function 10	Read Console Buffer
Entry Arguments	Reg Description C = 10 DE = buffer address
Explanation	The Read Console Buffer function reads an entire line of edited input from the console. The input buffer whose address is passed in register DE has the following structure:
	Offset Direction Description 0 passed max input size (N) 1 returned actual input (0-N) 2 to N+1 returned input characters
	The first byte of the buffer must be preset to the maximum number of characters allowed in the input line.
	Console input is accepted until terminated by a carriage-return. Input errors may be cor- rected by typing BACKSPACE or DELETE to erase one character at a time, or CTRL-U or CTRL-X to erase the entire line. Characters in excess of the maximum are not accepted, and diagnosed with a "beep". Input characters are echoed to the console screen. Unlike CP/M, this function does not expand tabs in TurboDOS.
	Upon return, the second byte of the buffer contains the actual number of input charac- ters in the buffer. The input line is returned starting at the third byte of the buffer. The terminating carriage-return is neither stored in the buffer nor included in the count. Unused buffer positions following the last input character are uninitialized.

C-Function 11 Get Console Status

C-Function 11	Get Console Status
Entry Arguments	Reg Description
	C = 11
Returned Value	Reg Description
	<pre>A = -1 if console input is available 0 if console input is not available</pre>
Explanation	The Get Console Status function checks to see whether or not a console input character is available. If console input is available, it returns A = -1. Otherwise, it returns A = 0.

TurboDOS 1.3 Z80 Programmer's Guide

C-Function 12 Return Version

C-Function 12	Return Version
Entry Arguments	Reg Description
	C = 12
Returned Value	Reg Description H = 00H (meaning: CP/M, not MP/M) L = 31H (meaning: BDOS version 3.1)
Explanation	The Return Version function provides informa- tion on the latest compatible version of CP/M. (The BDOS version number returned in register L may be changed by patching the symbol CPMVER during system generation.)

TurboDOS 1.3 Z80 Programmer's Guide

C-Function 13 Reset Disk System

C-Function 13	Reset Disk System
Entry Arguments	Reg Description C = 13
Explanation	In TurboDOS, the only effect of the Reset Disk System function is to reset the current DMA address to 0080H. (See C-function 26, Set DMA Address.)

TurboDOS 1.3 Z80 Programmer's Guide

C-Function 14 Select Disk

C-Function 14 Select Disk Entry Arguments Reg | Description C = 14 E = selected disk drive: 0 for drive A 0 for drive A 1 for drive B 1 1 for drive P 15 for drive P 15 for drive P Explanation The Select Disk function causes the disk drive specified in register E to be selected as the current (default) disk drive. The current drive is used in subsequent file

set to zero.

operations whenever the FCB drive field is

4-16

C-Function 15 Open File

C-Function 15	Open File
Entry Arguments	Reg Description C = 15 DE = FCB address
Returned Value	RegDescriptionA = 0 if successful-1 if file not found
Explanation	The Open File function opens the file speci- fied by the FCB drive, name, type, and extent fields (bytes 0 through 12). Normally, the extent field (byte 12) should be set to zero. The specified file must exist under the cur- rent user number or must be a global file under user 0. The open mode is determined by compatibility flag bit 7 (permissive) and by the FCB inter- face attributes f5 and f6, as shown in the following table: <u>permissive flag = 0</u> <u>permissive flag = 1</u> <u>if6 f5 open mode f6 f5 open mode </u> 0 0 exclusive 0 0 permissive 0 1 shared 0 1 shared 1 0 read-only 1 0 read-only 1 1 permissive 1 1 exclusive 1 1 fthe FCB current record field (byte 32) is set to -1, this function returns the byte count of the last record of the file in the current record field. The calling program should zero the current record field before

C-FUNCTIONS

C-Function 16 Close File

an eige an	
C-Function 16	Close File
Entry Arguments	Reg Description C = 16 DE = FCB address
Returned Value	Reg Description A = 0 if successful -1 if file not found
Explanation	The Close File function closes a file pre- viously opened by an Open File (15) or Make File (22) C-function. The directory is up- dated if necessary to reflect any new blocks allocated to the file, and any locked records are unlocked. If FCB interface attribute f5 is set, this function performs a "partial close" operation
	which updates the directory but leaves the file open.

TurboDOS 1.3 Z80 Programmer's Guide

C-Function 17 Search for First

Warding the advantation and a state of the s	
C-Function 17	Search for First
Entry Arguments	Reg Description
	C = 17 DE = FCB address
Returned Value	Reg Description
	A = entry number (0-3) if successful -1 if file not found
Explanation	The Search for First function scans the directory for the first entry which matches the FCB drive, name, type, and extent fields (bytes 0 through 12) and the current user number. An ASCII question mark (3FH) in any FCB byte 1 through 12 is treated as a wild- card which matches any character in the cor- responding byte position of the directory entry.
	If the search is successful, this function returns a directory record (containing four 32-byte directory entries) at the current DMA address, and with a value in register A $(0-3)$ that indicates which of the four entries was found to match the FCB. If the search is not successful, the function returns -1 (OFFH) in register A.
	If the Search for First function succeeds in finding an entry which matches the given FCB, then C-function 18 (Search for Next) may be called repeatedly to locate all remaining matches in the directory.

C-FUNCTIONS

C-Function 17 Search for First (Continued)

Explanation A special situation occurs if the FCB drive (Continued) field (byte 0) is set to a question mark (3FH). In this case, the remainder of the FCB is ignored, the directory of the current drive is searched, and the Search for First function returns the very first directory entry (usually the volume label). The Search for Next function will then return each successive directory entry in sequence, regardless of user number. Even deleted entries are returned in this case.

C-FUNCTIONS

C-Function 18 Search for Next

C-Function 18	Search for Next
Entry Arguments	RegDescriptionC = 18
Returned Value	Reg Description A = entry number (0-3) if successful -1 if file not found
Explanation	The Search for Next function continues the search initiated by C-function 17 (Search for First). If the search is successful, this function returns a directory record (containing four 32 -byte directory entries) at the current DMA address, and with a value in register A (0-3) that indicates which of the four entries was found to match the FCB. If the search is not successful, the function returns -1 (OFFH) in register A.

C-FUNCTIONS

C-Function 19 Delete File

C-Function 19	Delete File
Entry Arguments	RegDescriptionC = 19DE = FCB address
Returned Value	A = 0 if successful -1 if no file was deleted
Explanation	The Delete File function deletes the file specified by the FCB drive, name, and type fields (bytes 0 through 11) and the current user number. ASCII question marks (3FH) may be used as wild-cards anywhere in the FCB name and type fields, in which case this function deletes all matching files.
	A program may delete a file that it has open, in which case a close is performed implicitly before the file is deleted. However, a pro- gram is not permitted to delete a file that another process has open, nor a file that has the read-only or FIFO attributes.

4-22

C-Function 20	Read Sequential
Entry Arguments	Reg Description C = 20 DE = FCB address
Returned Value	Reg Description A = 0 if successful 1 1 if at end-of-file 2 2 if reading unwritten data
Explanation	The Read Sequential function reads the next 128-byte record from a file into memory at the current DMA address. The given FCB must have been previously opened by an Open (15) or Make (22) C-function, and the FCB current record field (byte 32) initialized to zero. This function uses the FCB extent and current record fields to determine the record to be read, then increments the current record field in preparation for the next sequential operation. If the current record field over- flows, the next extent is opened and the current record field is reset to zero.

TurboDOS 1.3 Z80 Programmer's Guide

C-Function 21 Write Sequential

C-Function 21	Write Sequential
Entry Arguments	Reg Description
	C = 21 DE = FCB address
Returned Value	Reg Description
	A = 0 if successful l if file too large (>134 Mb) 2 if disk full or file read-only 8 if attempt to write locked record -1 if no directory space
Explanation	The Write Sequential function writes the next 128-byte record of a file from the current DMA address in memory. The given FCB must have been previously opened by an Open (15) or Make (22) C-function, and the FCB current record field (byte 32) initialized to zero.
	This function uses the FCB extent and current record fields to determine the record to be write, then increments the current record field in preparation for the next sequential operation. If the current record field over- flows, the next extent is opened (or created if it does not exist) and the current record field is reset to zero.

TurboDOS 1.3 Z80 Programmer's Guide

C-Function 22 Make File

C-Function 22	Make File
Entry Arguments	Reg Description
	C = 22 DE = FCB address
Returned Value	Reg Description
	A = 0 if successful -1 if directory full, file exists, or FCB invalid
Explanation	The Make File function creates a new (empty) file specified by the FCB drive, name, type, and extent fields (bytes 0 through 12). Nor- mally, the extent field (byte 12) should be set to zero. The directory entry for the new file is placed under the current user number. All file attributes are initialized to zero. A request to make a file that already exists is denied.
	The newly-created file is left in an open state. If the FCB interface attribute f5 is set, then the file is left open in shared mode. Otherwise, the file is left open in either exclusive or permissive mode, depend- ing on compatibility flag bit 7 (permissive).
	The calling program should zero the FCB cur- rent record field (byte 32) before doing sequential reads or writes on the file.

TurboDOS 1.3 Z80 Programmer's Guide

C-Function 23 Rename File

C-Function 23	Rename File
Entry Arguments	Reg Description
	C = 23 DE = FCB address
Returned Value	Reg Description
	A = 0 if successful -1 if file not found, file in-use, or file name invalid
Explanation	The Rename File function renames the file specified by the FCB drive, name, and type fields (bytes 0 through 11) and the current user number. The file is given the new name and type specified in bytes 17 through 27 of the FCB. Wild-card characters (ASCII ques- tion marks) are not allowed in either the old or new name. All remaining bytes of the FCB are disregarded by this function.
	A program may rename a file that it has open, in which case a close is performed implicitly before the file is renamed. However, a pro- gram is not permitted to rename a file that another process has open, nor a file that has the read-only attribute.
TurboDOS 1.3 Z80 Programmer's Guide

C-Function 24 Return Login Vector

C-Function 24	Return Login Vector
Entry Arguments	Reg Description C = 24
Returned Value	Reg Description HL = login rector
Explanation	The Return Login Vector function tests the ready status of all disk drives. It returns a 16-bit vector in register HL containing a one-bit for each drive that is ready for access, and a zero-bit for each drive that is not ready or not defined. The least signifi- cant bit corresponds to drive A, and the most significant bit to drive P. NOTE: This function is supported only if the optional module CPMSUP is included during TurboDOS system generation.

TurboDOS 1.3 Z80 Programmer's Guide

C-Function 25 Return Current Disk

C-Function 25	Return Current Disk
Entry Arguments	Reg Description
	C = 25
Returned Value	Reg Description
	A = current disk drive: 0 for drive A 1 for drive B
	i lo drive P
Explanation	The Return Current Disk function returns the identity of the current (default) disk drive in register A.

TurboDOS 1.3 Z80 Programmer's Guide

C-Function 26 Set DMA Address

		-		adala, aper - adale alter i bekaradara i generikada a aper-bada a aper-bada i aper-bada i aper-	an advertision where may water when some lists of game where allow a <u>thermapped pol</u> icies, define
C-Function	26	Set DMA	Address		

Entry Arguments

1	Reg		Description
ł	С	=	26
	DE	=	DMA address
١.			

Explanation The Set DMA Address function causes the memory address specified in register DE to be used as the record buffer address for subsequent file read and write operations. In a banked memory system, the DMA address is always interpreted as an address in the same memory bank as the TPA.

> Whenever a program is loaded into the TPA, the DMA address is initialized to 0080H, the address of the default record buffer in the Base Page. C-function 13 (Reset Disk System) also sets the DMA address to 0080H.

TurboDOS 1.3 Z80 Programmer's Guide

C-Function 27 Get ALV Address

C-Function 27	Get ALV Address
Entry Arguments	Reg Description C = 27
Returned Value	Reg Description HL = 0 Image: Second
Explanation	This function performs no operation in Turbo- DOS. (Under CP/M, it returns the address of the memory-resident allocation vector for the current disk.)

TurboDOS 1.3 Z80 Programmer's Guide

Entry Arguments

C-Function 28 Write Protect Disk

ann an an ann an an an an an an an an an					 	
C-Function	28	Write	Protect	Disk		

Reg Descr	iption

Explanation The Write Protect Disk function marks the current (default) disk drive as read-only, preventing any program from writing to the disk. C-function 37 (Reset Drive) must be used to enable writes to the disk once again.

> Unlike CP/M, TurboDOS does not re-enable writing after warm-start, C-function 0 (System Reset), or C-function 13 (Reset Disk System). Consequently, write-protection of a disk drive is not nearly so temporary as it is in CP/M.

> NOTE: This function is supported only if the optional module CPMSUP is included during TurboDOS system generation.

TurboDOS 1.3 Z80 Programmer's Guide

C-Function 29 Get Read-Only Vector

an an air air an	
C-Function 29	Get Read-Only Vector
Entry Arguments	RegDescriptionC = 29
Returned Value	Reg Description HL = read-only vector
Explanation	The Get Read-Only Vector function returns a 16-bit vector in register HL containing a one-bit for each disk drive that is write- protected, and a zero-bit for each drive that is not. The least significant bit corres- ponds to drive A, and the most significant bit to drive P. NOTE: This function is supported only if the optional module CPMSUP is included during TurboDOS system generation.

TurboDOS 1.3 Z80 Programmer's Guide

C-Function 30 Set File Attributes

C-Function 30	Set File Attributes
Entry Arguments	Reg Description
	C = 30 DE = FCB address
Returned Value	Reg Description
	A = 0 if successful -1 if file not found or in-use
Explanation	The Set File Attributes function searches the directory for the file specified by the FCB drive, name, and type fields (bytes 0 through 11) and the current user number, and updates the file attributes in the directory from those in the FCB. (File attributes are stored in the high-order bit of FCB bytes 1-4 and 9-11.)
	In addition, if FCB interface attribute f6 is set, this function updates the last record byte count of the file. The count is ob- tained from the current record field (byte 32) of the FCB, and stored in the specl field (byte 13) of each directory entry.
	A program may set attributes on a file that it has open, in which case a close is per- formed implicitly before the attributes are set. However, a program is not permitted to set attributes on a file that another process has open.

TurboDOS 1.3 Z80 Programmer's Guide

C-Function 31 Get DPB Address

C-Function 31	Get DPB Address
Entry Arguments	Reg Description
	C = 31
Returned Value	Reg Description
	HL = DPB address
Explanation	The Get DPB Address function causes TurboDOS to construct a CP/M-style Disk Parameter Block (DPB) for the current drive, and to return its memory address in register HL.
	NOTE: This function is supported only if the optional module CPMSUP is included during TurboDOS system generation.

TurboDOS 1.3 Z80 Programmer's Guide

C-Function 32 Get/Set User Number

C-Function 32	Get/Set User Number
Entry Arguments	Reg Description
	C = 32 E = -1 to get user number 0-31 to set user number
Returned Value	Reg Description
	A = user number 0-31
Explanation	The Get/Set User Number function can be used either to set or to return the current user number. If the value -1 (OFFH) is passed ir register E, this function returns the current user number in register A. If some other value is passed in register E and if the caller is a privileged log-on, this function sets the current user number to the specified value (modulo 32). A request to set the current user number from a non-privileged log-on is ignored.

TurboDOS 1.3 Z80 Programmer's Guide

C-Function 33 Read Random

C-Function 33	Read Random	
Entry Arguments	Reg Description C = 33 DE = FCB address	
Returned Value	Reg Description A = 0 if successful 1 if reading unwritten data 3 if error changing extents 4 if reading unwritten extent 6 if random record number invalid	
Explanation	The Read Random function reads a 128-byte record from a file into memory at the current DMA address. The particular record to be read is specified by a 20-bit random record number obtained from FCB random record field (bytes 33 through 35). The given FCB must have been previously opened by an Open (15) or Make (22) C-function. This function sets the FCB extent and current record fields to correspond with the record that was read. Unlike C-function 20 (Read Sequential), however, it does not increment the current record field after reading.	
	Thus, if the Read Random function is followed by a Read Sequential or Write Sequential, the same record is re-accessed.	

C-FUNCTIONS

C-Function 34 Write Random

C-Function 34	Write Random
Entry Arguments	Reg Description
	C = 34 DE = FCB address
Returned Value	Reg Description
	<pre>A = 0 if successful 2 if disk full or write-protected 3 if error changing extents 5 if no directory space 6 if random record number invalid 8 if writing locked record</pre>
Explanation	The Write Random function writes a 128-byte record to a file from the current DMA address in memory. The particular record to be writ- ten is specified by a 20-bit random record number obtained from FCB random record field (bytes 33 through 35). The given FCB must have been previously opened by an Open (15) or Make (22) C-function.
	This function sets the FCB extent and current record fields to correspond with the record that was written. Unlike C-function 21 (Write Sequential), however, it does not increment the current record field after writing. Thus, if the Write Random function is followed by a Read Sequential or Write Sequential, the same record is re-accessed.

C-Function 35 Compute File Size

C-Function 35	Compute File Size
Entry Arguments	RegDescriptionC = 35DE = FCB address
Returned Value	Reg Description A = 0 if successful -1 if file not found
Explanation	The Compute File Size function searches the directory for the file specified by the FCB drive, name, and type fields (bytes 0 through 11). If the file is found, this function sets the FCB random record field (bytes 33 through 35) to a value one greater than the record number of the last record in the file. Thus, a succeeding Write Random function (34) will append an additional record at the end of the file. In TurboDOS, the Compute File Size function returns the correct result whether the file is open or closed.

TurboDOS 1.3 280 Programmer's Guide

TurboDOS 1.3 280 Programmer's Guide

C-Function 36 Set Random Record

C-Function 36	Set Random Record
Entry Arguments	RegDescriptionC = 36DE = FCB address
Explanation	The Set Random Record function returns the current file position of an open file in the random record field (bytes 33-35) of the FCB. (The file position is determined from the values of the FCB extent, spec2, and current record fields.) Since the Read Sequential (20) and Write Sequential (21) functions do not update the random record field of the FCB, this function is useful when switching from sequential to random access.

4-39

C-FUNCTIONS

C-Function 37 Reset Drive

C-Function 37	Reset Drive		
Entry Arguments	Reg Description C = 37 DE = reset vector		

Explanation The Reset Drive function write-enables the disk drives specified by the 16-bit reset vector passed in register DF. The reset vector contains a one-bit for each disk drive that is to be write-enabled, and a zero-bit for each drive that is not. The least significant bit corresponds to drive A, and the most significant bit to drive P.

NOTE: This function is supported only if the optional module CPMSUP is included during TurboDOS system generation.

C-FUNCTIONS

C-Function 40 Write Random 0-Fill

C-Function 40	Write Random with Zero Fill
Entry Arguments	Reg Description
	C = 40 DE = FCB address
Returned Value	Reg Description
	A = 0 if successful 2 if disk full or write-protected 3 if error changing extents 5 if no directory space 6 if random record number invalid 8 if writing locked record
Explanation	The Write Random with Zero Fill function is implemented in TurboDOS as a synonym for Write Random (C-function 34).

TurboDOS 1.3 Z80 Programmer's Guide

C-Function 42 Lock Record

C-Function 42	Lock Record
Entry Arguments	Reg Description C = 42 DE = FCB address
Returned Value	RegDescriptionA = 0 if successful1 if positioning to unwritten data3 if error changing extents4 if positioning to missing extent6 if random record number invalid8 if locked by another process
Explanation	The Lock Record function attempts to obtain a lock on the record specified by a 20-bit random record number obtained from FCB random record field (bytes 33 through 35). The given FCB must have been previously opened in shared mode. If the file is not open in shared mode, this function performs no opera- tion and returns a successful result.
	The file is positioned to the specified record, unless compatibility flag bit 3 (logical) is set. If the specified record is already locked by another process, this func- tion either suspends or returns an error (A=8) depending upon the setting of compati- bility flag bit 6 (suspend).
	If the FCB random record field is set to the 24-bit value OFFFFFH, then this function attempts to obtain an all-inclusive lock (on all records of the file at once). In this case, no positioning is performed.

C-FUNCTIONS

C-Function 43 Unlock Record

C-Function 43	Unlock Record
Entry Arguments	RegDescriptionC = 43DE = FCB address
Returned Value	RegDescriptionA = 0 if successfulI1 if positioning to unwritten data3 if error changing extents4 if positioning to missing extent6 if random record number invalid
Explanation	The Unlock Record function unlocks the record specified by a 20-bit random record number obtained from FCB random record field (bytes 33 through 35). Attempting to unlock a record which was not previously locked does not return an error. The given FCB must have been previously opened in shared mode. If the file is not open in shared mode, this function performs no operation and returns a successful result.
	The file is positioned to the specified record, unless compatibility flag bit 3 (logical) is set.
	If the FCB random record field is set to the 24-bit value OFFFFFH, then this function releases any all-inclusive lock on the file, but does not affect any individual record locks. In this case, no positioning is per- formed.

TurboDOS 1.3 280 Programmer's Guide

C-Function 46 Get Disk Free Space

C-Function 46	Get Disk Free Space
Entry Arguments	RegDescriptionC = 46E = disk drive:0 for drive A1 for drive B
	15 for drive P
Returned Value	Reg Description A = 0
Explanation	The Get Disk Free Space function determines the amount of free space on the specified disk drive. It returns a 24-bit binary value (the number of free 128-byte records) as a three byte quantity stored at the current DMA address, least significant byte first.

TurboDOS 1.3 Z80 Programmer's Guide

C-Function 47 Chain to Program

C-Function 47	Chain to Program
Entry Arguments	Reg Description C = 47 Image: Comparison of the second
Explanation	The Chain to Program function provides a means of chaining from one program to another. The calling program must place a valid TurboDOS command line, terminated by a null byte, in the Base Page record buffer starting at location 0080H. This function terminates the calling program, and then executes the command line.
	If $E = 0$, the current disk reverts to what it was when the calling program was originally loaded into the TPA (the normal warm-start procedure). If $E = -1$, however, the current disk at the time of call is retained.

TurboDOS 1.3 280 Programmer's Guide

C-Function 104 Set Date and Time

C-Function 104 Set Date and Time -----Entry Arguments Reg Description C = 104DE = date/time packet address The Set Date and Time function sets the Explanation system date and time. The address of a fourbyte date/time packet is passed in DE. The date/time packet has the following structure: Offset Description 0-1 Date, represented as a 16-bit Julian date with 0000H corresponding to 31 December 1977. 2 Hours, represented as two binary coded decimal (BCD) digits Minutes, represented as two bi-3 nary coded decimal (BCD) digits

Seconds are set to zero.

C-Function 105 Get Date and Time

C-Function 105	Get Date	and Time
Entry Arguments	Reg	Description
	C = 1 DE = d	05 late/time packet address
Returned Value	Reg	Description
	A = s	econds (two BCD digits)
Explanation	The Get I system da packet w date/time	Date and Time function returns the te and time in a four-byte date/time hose address is passed in DE. The packet has the following structure:
	Offset	Description
	0-1	Date, represented as a 16-bit Julian date with 0000H corre- sponding to 31 December 1977.
	2	Hours, represented as two binary coded decimal (BCD) digits
	3	Minutes, represented as two bi- nary coded decimal (BCD) digits
	I	

Seconds are returned in register A, represented as two binary coded decimal (BCD) digits.

C-FUNCTIONS

C-Function 107 Return Serial Number

Manager and the same and	
C-Function 107	Return Serial Number
Entry Arguments	Reg Description C = 107 DE = address of 6-byte S/N field
Explanation	The Return Serial Number function returns the CP/M serial number in the 6-byte field whose address is passed in DE. Under TurboDOS, this function always returns six zero bytes.
	NOTE: This function is supported only if the optional module CPMSUP is included during TurboDOS system generation.

C-FUNCTIONS

C-Function 108 Get/Set Return Code

der an er die de	
C-Function 108	Get/Set Program Return Code
Entry Arguments	Reg Description
	C = 108 DE = OFFFFH (if get) program return code (if set)
Returned Value	Reg Description
	HL = program return code (11 get)
Explanation	The Get/Set Program Return Code function provides a means for one program to pass a l6-bit value to another program. For ex- ample, this function can be used to advantage in connection with C-function 47 (Chain to Program).
	If register DE is set to OFFFFH, then this function interrogates the program return code and returns it in register HL. Otherwise, this function sets the program return code to the value passed in register DE.

C-Function 110 Get/Set Delimiter

C-Function 110	Get/Set Program Output Delimiter
Entry Arguments	Reg Description
	C = 110 DE = 0FFFFH (if get), or E = output delimiter (if set)
Returned Value	Reg Description
	A = output delimiter (if get)
Explanation	The Get/Set Output Delimiter function can be used to set or interrogate the output delimi- ter used by C-function 9 (Print String). Whenever a program is loaded into the TPA, the output delimiter is initialized to the dollar sign \$ character.
	If register DE is set to OFFFFH, then this function interrogates the current output delimiter and returns it in register A. Otherwise, this function sets the output delimiter to the value passed in register E.

TurboDOS 1.3 Z80 Programmer's Guide

TurboDOS 1.3 Z80 Programmer's Guide

C-Function 111 Print Block

C-Function 111	Print Block	
Entry Arguments	Reg C = 111 DE = CCB	Description

Explanation The Print Block function displays a string of characters on the console screen. The string may be of any length, and is defined by a Character Control Block (CCB) whose address is passed in register DE. The CCB is four bytes long, and has the following structure:

	Offset	Description	
1	0-1	starting address of string	i
1	2-3	byte-length of string	ļ

Horizontal tabs are expanded into multiple spaces, based upon tab stops at every eighth column.

TurboDOS 1.3 Z80 Programmer's Guide

C-Function 112 List Block

C-Function 112	List Block
Entry Arguments	Reg Description C = 112 DE = CCB address
Explanation	The List Block function sends a string of characters to be printed according to the current print routing. The string may be of any length, and is defined by a Character Control Block (CCB) whose address is passed in register DE. The CCB is four bytes long, and has the following structure:
	Offset Description 0-1 starting address of string 2-3 byte-length of string

~ --

Horizontal tabs are not expanded.

C-FUNCTIONS

C-Function 152 Parse Filename

C-Function 152	Parse Filename
Entry Arguments	Reg Description C = 152 DE = PFCB address
Returned Value	Reg Description
	HL = 0 if successful and end of line OFFFFH if error while parsing delimiter address otherwise
Explanation	The Parse Filename function parses an ASCII file specification of the form:
	<pre>{d:}filename{.typ}</pre>
	into FCB format. The FCB drive, name, and type fields (bytes 0 through 11) are initialized according to the parsed file specification. Bytes 12 through 15 of the FCB are zeroed.
	This function is called with the address of a Parse Filename Control Block (PFCB) in DE. The PFCB is four bytes long, and has the following structure:
	Offset Description 0-1 address of ASCII input string 2-3 address of destination FCB
	This function parses the first file specification it finds in the input string. Leading spaces are ignored. Parsing stops upon encountering a space, comma, semicolon, equal-sign, or any ASCII control character.

T-FUNCTIONS	This section describes the 44 TurboDOS-unique functions ("T-functions") which supplement the C-functions described in the previous section. The T-functions are presented in numerical order, with calling parameters, return values, and a detailed explanation for each.
	To invoke a T-function, a program executes a CALL to location 0050H in the Base Page with a function number in register C. Arguments are passed and values returned in registers, as described below for each T-function.
	If a T-function call is made with register C set to an unsupported function number, Turbo- DOS returns immediately with register A set to zero.
	T-function calls generally destroy registers $A-B-C-D-E-H-L$, but preserve X, Y, and the alternate register set.

T-FUNCTIONS

T-Function 0 Reset Operating Sys.

T-Function 0	Reset Operating System
Entry Arguments	Reg Description C = 0
Explanation	The Reset Operating System function unlocks all locked records, closes all open files, unlocks all locked drives, and terminates any network sessions involving the calling process.
	TurboDOS automatically performs this function at each program termination (warm-start), so it is almost never necessary for a program to call this function explicitly.

T-FUNCTIONS

T-Function 1 Create Process

T-Function 1	Create Process	
Entry Arguments	Reg Description	
	DE = entrypoint address HL = workspace address	
Returned Value	Reg Description	
	A = 0 if successful -1 if insufficient memory	
Explanation	The Create Process function creates a new process which starts execution at the entry- point address passed in register DE. The new process is assigned a TurboDOS work area whose address appears to the new process in index register X, and a 64-word stack area whose address appears in the stack pointer register. If the process requires a re- entrant work area (usually allocated dynamic- ally using T-function 3), its address should be passed in register HL and will appear to the new process in index register Y.	
	If this function is called with register DE set to zero, it causes the calling process to terminate.	
	NOTE: This function is not intended for use by transient programs, and must be used with great care.	

TurboDOS 1.3 Z80 Programmer's Guide

> T-Function 2 Delay Process

T-Function 2

Delay Process

Entry Arguments

Reg	Description	
C = 2 DE = tick	count	

Explanation The Delay Process function causes the calling process to be suspended for the period of time specified by the tick count passed in register DE. A system "tick" is an implementation-dependent time interval, usually 1/50 or 1/60 of a second. The actual delay may vary from the requested tick count by plus or minus one tick.

If the specified tick count is zero, then the calling program is suspended only long enough to allow any other ready processes to run (a so-called "courtesy" dispatch).

T-FUNCTIONS

T-Function 3 Allocate Memory

T-Function 3	Allocate Memory	
Entry Arguments	Reg	Description
	C = 3 DE = byte-length c	of requested segment
Returned Value	Reg	Description
	A = 0 if successi -1 if insuffi HL = segment addre	ful icient memory ess (if successful)
Explanation	The Allocate Memory function allocates a contiguous memory segment of the byte-length requested in register DE. If successful, the starting address of the allocated segment is returned in register HL.	
	NOTE: This function by transient program great care. If a men by a transient program before the program te is lost permanently.	is not intended for use s, and must be used with mory segment is allocated ram and not deallocated erminates, then the space

TurboDOS 1.3 Z80 Programmer's Guide

T-Function 4 Deallocate Memory

and the statement of th	
T-Function 4	Deallocate Memory
Entry Arguments	Reg Description C = 4 DE = segment address
Explanation	The Deallocate Memory function returns a previously-allocated memory segment to the pool of available memory space.
	NOTE: This function is not intended for use by transient programs, and must be used with great care. The address passed in DE must be a segment starting address returned by a prior call to C-function 3 (Allocate Memory), otherwise a system crash may occur.

T-FUNCTIONS

T-Function 5 Send I/P Message

T-Function 5	Send Interprocess Message
Entry Arguments	Reg Description C = 5 DE = message node address HL = message address
Explanation	The Send Interprocess Message function pro- vides a means to send messages from one pro- cess to another. Register DE specifies the address of a 10-byte message node which must be initialized as follows:
	MSGNOD: .WORD 0 ;semaphore count .WORD MSGNOD+2 ;semaphore head .WORD MSGNOD+2 ; " " .WORD MSGNOD+4 ;msg chain head .WORD MSGNOD+4 ; " " "
	Register HL specifies the address of the message to be sent, which must be prefixed by a 4-byte linkage as follows:
	MESSAG: .WORD 0 ;message linkage .WORD 0 ; " " BYTE ;message text .BYTE ;(any length)
	NOTE: This function is not intended for use by transient programs, and must be used with great care.

T-Function 6 Receive I/P Message

T-Function 6	Receive Interprocess Message
Entry Arguments	Reg Description
	C = 6 DE = message node address
Returned Value	Reg Description
	HL = message address
Explanation	The Receive Interprocess Message function provides a means to receive messages sent by another process using C-function 5 (Send Interprocess Message). Register DE specifies the address of a 10-byte message node which must be initialized as follows:
	MSGNOD: .WORD 0 ;semaphore count .WORD MSGNOD+2 ;semaphore head .WORD MSGNOD+2 ; " " .WORD MSGNOD+4 ;msg chain head .WORD MSGNOD+4 ; " "
	If no message is available from the specified message node, the calling process is suspen- ded until a message arrives. This function returns in HL the address of the received message prefixed by a 4-byte linkage.
	NOTE: This function is not intended for use by transient programs, and must be used with great care.

TurboDOS 1.3 Z80 Programmer's Guide

T-FUNCTIONS

T-Function 7 Set Error Address

T-Function 7

Set Error Address

Entry Arguments

Reg	Description
C == DE =	7 error intercept routine address, or 0 to restore default error handling

Explanation The Set Error Address function enables a program to establish its own error intercept routine to intercept and process unrecoverable disk errors. The address of the intercept routine is passed in register DE. Normal TurboDOS error diagnosis is supressed.

> The error intercept routine must <u>not</u> call any TurboDOS functions, and must return via a RET instruction with register A set to the desired error recovery alternative:

A-reg	Recovery Action	Ì
	retry operation	
+1	ignore error	1
-1	abort program	1

If the Set Error Address function is called with register DE set to zero, normal TurboDOS error diagnosis is restored. This also happens automatically when the program terminates.
T-Function 8 Set Abort Address

T-Function 8 Set Abort Address Entry Arguments | Reg | Description C = 8 DE = abort intercept routine address, or | 0 to restore default abort handling Explanation The Set Abort Address function enables a program to establish its own abort intercept routine to intercept and process user-requested aborts (in response to attention-requests or disk errors). The address of the intercept routine is passed in register DE. The abort intercept routine may exit via a RET instruction to resume execution of the program at the point of interruption. Alternatively, it may proceed with any desired wrap-up processing and then terminate the program. If the Set Abort Address function is called with register DE set to zero, normal TurboDOS abort handling restored. This also happens automatically when the program terminates.

TurboDOS 1.3 280

Programmer's Guide

TurboDOS 1.3 Z80 Programmer's Guide

T-Function 9 Set Date and Time

T-Function 9	Set Date and Time
Entry Arguments	RegDescriptionC = 9HL = Julian date (0 is 31 December 1947)D = hours (0-23, binary integer)E = minutes (0-59, binary integer)B = seconds (0-59, binary integer)
Explanation	The Set Date and Time function sets the sys- tem date and time. The Julian date passed in register HL is the number of days since the base date of 31 December 1947. Dates prior to the base date are represented by negative values.
	The system date and time may also be set by means of C-function 104 (Set Date and Time), but the format of arguments is considerably different.

T-Function 10 Get Date and Time

T-Function 10	Get Date and Time
Entry Arguments	Reg Description
	C = 10
Returned Value	Reg Description
	HL = Julian date (0 is 31 December 1947) D = hours (0-23, binary integer) E = minutes (0-59, binary integer) B = seconds (0-59, binary integer) A = system tick count
Explanation	The Get Date and Time function returns the system date and time. The Julian date re- turned in register HL is the number of days since the base date of 31 December 1947. Dates prior to the base date are represented by negative values.
	The system tick count returned in register A is incremented every system tick. It counts from zero to 255, then wraps around to zero. A system tick is an implementation-dependent time interval, usually 1/50 or 1/60 of a second.
	The system date and time may also be interro- gated by means of C-function 105 (Get Date and Time), but the format of returned values is considerably different.

TurboDOS 1.3 Z80 Programmer's Guide

TurboDOS 1.3 Z80 Programmer's Guide

T-Function 11 Rebuild Disk Map

T-Function 11 Re

Rebuild Disk Map

Entry Arguments

Reg | Description C = 11 E = disk drive: 0 for drive A 1 for drive B : 15 for drive P

Returned Value

 Reg |
 Description

 A = 0 if successful
 -1 if disk write-protected

 or has files open
 -1

Explanation

The Rebuild Disk Map function regenerates the allocation map on the disk drive specified in register E. The principal purpose of this function is to support the FIXMAP command.

TurboDOS 1.3 Z80 Programmer's Guide

T-Function 12 Return Serial Number

T-Function 12	Return Serial Number
Entry Arguments	Reg Description C = 12
Returned Value	Reg Description HL = TurboDOS origin number DE = TurboDOS unit number B = 0 if non-privileged log-on 80H if privileged log-on C = 13H (TurboDOS version 1.3)
Explanation	The Return Serial Number function returns the origin and unit numbers with which this par- ticular copy of TurboDOS was serialized, and

may be used in application programs to help prevent unauthorized use. This function also returns the TurboDOS ver-

sion number, and a flag which indicates whether or not the current log-on is privileged.

TurboDOS 1.3 Z80 Programmer's Guide

T-Function 13 Set Compatibility

T-Function 13	Set Compatibility Flags
Entry Arguments	RegDescriptionC = 13E = compatibility flags:bit 7 = permissive flagbit 6 = suspend flagbit 5 = global-write flagbit 4 = mixed-mode flagbit 3 = logical flag(bits 2-0 not defined)
Explanation c	The Set Compatibility Flags function enables a program to modify the rules by which file sharing is done. The meaning of each compa- tibility flag is described in section 2. When the program terminates, the compatibili- ty flags revert automatically to the default values assigned to the public symbol COMPAT at system generation.

TurboDOS 1.3 Z80 Programmer's Guide

T-Function 14 Log-On/Log-Off

```
T-Function 14
                   Log-On/Log-Off
Entry Arguments
                     Req
                                      Description
                      C = 14
                      DE = OFFFFH (if log-off)
                      E = user number 0-31 (if log-on)
                           with bit 7 set for privileged
                      D = current disk drive (if log-on):
                            -1 for no change
                             0 for drive A
                             1 for drive B
                            15 for drive P
Returned Value
                                      Description
                    Reg
                      A = 0 if successful
                           -l if request invalid
Explanation
                   The Log-On/Log-Off function is provided to
                   support log-on security via the LOGON and
                   LOGOFF commands. To log-on, this function is
                   called with the desired user number in regis-
                   ter E (with bit 7 set if a privileged log-on
                   is desired), and with the desired current
                   drive in register D (or -1 for no change in
                   current drive). To log-off, the function is
                   called with both DE set to OFFFFH.
                   After a log-off, another log-on request is
                   not honored until a warm-start or C-function
                   0 (System Reset) has occurred.
                   NOTE: When this function is called from a
                   resident system process, the D-register argu-
                   ment is ignored.
```

T-FUNCTIONS

T-Function 15 Load File

T-Function 15	Load File
Entry Arguments	Reg Description
	C = 15 DE = FCB address
Returned Value	Reg Description
	A = 0 if successful l if not enough memory to load file -l if file not found
Explanation	The Load File function loads the file speci- fied by the FCB drive, name, and type fields (bytes 0 through 11) into memory starting at the current DMA address. The file need not have been opened. If the specified drive is local to the processor in which the call is made, the program load optimizer is used. If the top of the TPA is reached before the end- of-file is encountered, the loading stops and an error is returned.
	This function is used by the TurboDOS command interpreter to load .COM files into the TPA, and may also be used by application programs to fetch overlays.

T-FUNCTIONS

T-Function 16 Activate Do-File

Entry Arguments	Reg Description
	C = 16 DE = FCB address (to activate) 0 (to cancel)
Returned Value	Reg Description
	A = 0 if successful -1 if file not found
Explanation	The Activate Do-File function causes the file specified by the FCB drive, name, and type fields (bytes 0 through 11) to be activated as a do-file. The file need not have been opened. Any currently-active do-file and/or command line is stacked (to be reactivated when the new do-file has been processed to completion). The principal purpose of this function is to support the DO command.
	This function may also be called with DE set to zero to cancel all active and stacked do- files.

TurboDOS 1.3 Z80 Programmer's Guide

T-Function 17 Dis/Enable Autoload

Disable/Enable Autoload Arguments Reg C = 17 E = 0 to disable autoload -1 to enable autoload
Arguments C = 17 E = 0 to disable autoload -1 to enable autoload
The Disable/Enable Autoload function may be used to disable the warm-start autoload fea- ture of TurboDOS, or to re-enable the feature after it has been disabled. TurboDOS automatically disables the warm- start autoload feature whenever it fails to find the file WARMSTRT.AUT on the current disk during a warm-start. Creating such a file on disk (or changing the current disk to one that contains such a file) will not result in autoloading unless the autoload
start autoload feature whenever it fa find the file WARMSTRT.AUT on the cu disk during a warm-start. Creating a file on disk (or changing the current d one that contains such a file) will result in autoloading unless the auto feature is complicitly recompled by me

T-FUNCTIONS

T-Function 18 Send Command Line

T-Function 18	Send Command Line
Entry Arguments	RegDescriptionC = 18DE = buffer address (to send)0 (to cancel)
Explanation	The Send Command Line function allows a pro- gram to specify the next command line to be processed by TurboDOS after the program ter- minates. The buffer address is passed in register DE. The first byte of the buffer must contain the command line byte-length, and the command line text must occupy the second and succeeding bytes of the buffer. Any currently-active command line is stacked, and the new command line is activated.
	This function may also be called with DE set to zero to cancel all active and stacked command lines.

T-FUNCTIONS

T-Function 19 Return Alloc Info

T-Function 19	Return Disk Allocation Information
Entry Arguments	Reg Description
2 5	C = 19 E = disk drive: 0 for drive A 1 for drive B : 15 for drive P
Returned Value	Reg Description
	<pre>A = block size:</pre>
Explanation	The Return Disk Allocation Information func- tion returns various parameters concerning the logical organization of the specified disk drive.

5-21

TurboDOS 1.3 Z80 Programmer's Guide

T-Function 20 Return Physical Info

T-Function 20 Return Physical Disk Information Entry Arguments Reg Description C = 20E = disk drive:0 for drive A l for drive B 15 for drive P Returned Value Reg Description A = physical sector size: 0 for 128-byte sectors 1 for 256-byte sectors 2 for 512-byte sectors 3 for 1K sectors 7 for 16K sectors BC = number of reserved (boot) tracks DE = total number of tracks on the disk HL = number of sectors per track Explanation The Return Physical Disk Information function

The Return Physical Disk Information function returns various parameters concerning the format and physical organization of the specified disk drive.

TurboDOS 1.3 Z80 Programmer's Guide

T-Function 21 Get/Set Drive Status

T-Function 21	Get/Set Drive Status
Entry Arguments	Reg Description
	C = 21 E = disk drive: 0 for drive A 1 for drive B
	15 for drive P D = 0 to set the drive read/write 1 to set the drive read-only -1 to return the drive status
Returned Value	Reg Description
	A = 0 if successful -1 if attempt to set drive status while files are open
	L = 0 if drive is not ready
	H = 0 if drive is read/write -1 if drive is read-only
Explanation	The Get/Set Drive Status function may be used to interrogate the ready and write-protect status of the drive specified by register E. This function may also be used to change the write-protect status of the drive. The code passed in register D controls which of these operations is performed, as indicated above.

T-Function 22 Physical Disk Access

T-Function 22	Physical Disk Access
Entry Arguments	RegDescriptionC = 22DE = PDR packet address
Returned Value	Reg Description A = 0 if read/write successful, or drive not ready -1 if read/write unsuccessful, or drive is ready
Explanation	The Physical Disk Access function provides direct access to the physical disk drivers. The principal purpose of this function is to support the BOOT, BACKUP, FORMAT, and VERIFY commands. It is honored for privileged log- ons only, and may be used only for disk drives local to the calling processor. Register DE contains the address of a 14-byte physical disk request (PDR) packet with the following structure:
	OffsetDescription0disk operation code (0-4)1disk drive (0-15)2-3physical track number (base 0)4-5physical sector number (base 0)6-7number of sectors to read/write8-9number of bytes to read/write10-11DMA address for read/write12-13disk specification table address

The physical operation performed depends upon the disk operation code in the PDR packet.

TurboDOS 1.3 Z80 Programmer's Guide

TurboDOS 1.3 280 Programmer's Guide

T-Function 22 Physical Disk Access (Continued)

Explanation (Continued)	If the PDR opcode is 0, the specified number of physical sectors (or bytes) are read from the specified drive, track, and sector into the specified DMA address.
	If the PDR opcode is 1, the specified number of physical sectors (or bytes) are written to the specified drive, track, and sector from the specified DMA address.
	If the PDR opcode is 2, the type of the specified disk is determined, and an ll-byte disk specification table (DST) is returned at the specified DMA address, structured as follows:
	Offset Description
	0 block size (3=1K,4=2K,,7=16K) 1-2 total number of blocks on disk 3 number of directory blocks 4 sector size (0=128,,7=16K) 5-6 number of sectors per track 7-8 number of tracks on the disk 9-10 number of reserved (boot) tracks
	If the PDR opcode is 3, the ready status of the specified drive is returned in register A (0 if not ready, -1 if ready).
	If the PDR opcode is 4, the specified track of the specified drive is formatted, using hardware-dependent formatting information provided at the specified DMA address.

NOTE: Opcodes 0 (read) and 1 (write) require that the PDR packet contain the address of a valid DST for the specified disk. Therefore, opcode 2 (return DST) should be invoked first to obtain the DST.

T-FUNCTIONS

T-Function 23 Set Buffer Parameter

T-Function 23 Set Buffer Parameters Reg | Description Entry Arguments C = 23 D = number of buffers (minimum 2) E = buffer size:0 for 128-byte buffers 1 for 256-byte buffers 2 for 512-byte buffers 3 for 1K buffers : 7 for 16K buffers Explanation The Set Buffer Parameters function enables the number and size of disk buffers to be changed. The principal purpose of this function is to support the BUFFERS command. The specified number of buffers must be at least 2. If the specified number of buffers cannot be allocated due to insufficient memory, then TurboDOS allocates as many as it can. The specified buffer size must be as least as large as the largest physical disk sector size being used. If this function is called from a slave processor without local disk storage, then the function is passed over the network to be processed in the master.

T-Function 24 Get Buffer Parameter

T-Function 24	Get Buffer Parameters
Entry Arguments	Reg Description C = 24
Returned Value	RegDescriptionA = memory size in pages (0 if 64K)H = number of buffersL = buffer size:0 for 128-byte buffers1 for 256-byte buffers2 for 512-byte buffers3 for 1K buffers:7 for 16K buffers
Explanation	The Get Buffer Parameters function enables the number and size of disk buffers to be interrogated. The principal purpose of this function is to support the BUFFERS command. If this function is called from a slave pro- cessor without local disk storage, then the function is passed over the network to be processed in the master.

TurboDOS 1.3 Z80 Programmer's Guide

T-Function 25 Lock/Unlock Drive

T-Function 25	Lock/Unlock Drive
Entry Arguments	Reg Description
	C = 25 E = disk drive: 0 for drive A 1 for drive B : 15 for drive P D = 0 to unlock drive -1 to lock drive
Returned Value	Reg Description
	A = 0 if successful -1 if drive in-use or already locked by another process
Explanation	The Lock/Unlock Drive function enables a program to secure a lock on a specified disk drive. This function is used by many Turbo- DOS commands such as BACKUP, CHANGE, FIXDIR, FIXMAP, FORMAT, and VERIFY to ensure that they cannot compromise the processing of other users.

5-28

TurboDOS 1.3 Z80 Programmer's Guide

T-FUNCTIONS

T-Function 26 Flush/Free Buffers

T-Function 26

Flush/Free Buffers

Entry Arguments

Reg | Description С = 26 E = disk drive:0 for drive A 1 for drive B 15 for drive P D = subfunction flags: bit 7 set to free buffers unconditionally bit 6 set to free buffers after disk error abort bit 5 set to continue after disk error abort bit 4 set to return after disk error abort

Explanation The Flush/Free Buffers function causes all written-to disk buffers for the specified disk drive to be written out (flushed) to the disk. This function may cause disk buffers for the specified drive to be freed, conditionally or unconditionally, according to the subfunction flags passed in register D.

> It is suggested that this function be used prior to media changes and physical disk access (T-function 22).

T-Function 27 Get/Set Print Mode

T-Function 27	Get/Set Print Mode	
Entry Arguments	Reg Description	
	C = 27 E = print mode: 0 to print direct 1 to print spooled 2 to print to the console -1 to leave print mode unchanged D = printer assignment (if mode = 0) queue assignment (if mode = 1) -1 to leave assignment unchanged B = spool drive: 0 for drive A 1 for drive B : 15 for drive P -1 to leave spool drive unchanged	
Returned Value	RegDescriptionA = current spool driveH = current printer or queue assignmen	
Explanation	<pre>The Get/Set Print Mode function is used set or interrogate print routing, and provided to support the PRINT command. Printer and queue assignments are coded th 1 for A, 2 for B,, 16 for P. Assignment to queue zero causes print files to be 1 unqueued. Assignment to printer zero cau print output to be discarded. Setting assignment, mode, or spool drive implies immediate end-of-print-job condition. If registers B, D, and E are all set to this function simply interrogates and retu the current assignment, mode, and drive.</pre>	to is us: ent ses the an -1, rns

TurboDOS 1.3 Z80 Programmer's Guide

T-FUNCTIONS

T-Function 28 Signal End-of-Print

T-Function 28	Signal End-of-Print
Entry Arguments	Reg Description C = 28
Explanation	The Signal End-of-Print function causes an end-of-print condition. If spooling is in effect, the current print file is closed and (if appropriate) enqueued for background printing.
	An end-of-print condition may also occur as the result of a warm-start, attention re- quest, or end-of-print character.

TurboDOS 1.3 Z80 Programmer's Guide

T-Function 29 Get/Set Despool Mode

```
T-Function 29 Get/Set De-Spool Mode
                    Reg Description
Entry Arguments
                     C = 29
                     B = printer:
                           0 for printer A
                            1 for printer B
                               :
                           15 for printer P
                     E = de-spool mode:
                            0 to process print job
                            1 to suspend print job
                            2 to begin print job over
                            3 to terminate print job
                            -1 to leave mode unchanged
                     D = de-spool queue assignment:
                            0 to set printer off-line
                            1 for queue A
                            2 for queue B
                           16 for queue P
                           -1 to leave queue unchanged
                   Reg | Description
Returned Value
                     A = 0 if successful
                     -1 if invalid request
                     H = current queue assignment (0-16)
                     L = current de-spool mode (0 or 1)
                  The Get/Set De-Spool Mode function is used to
Explanation
                  control background printing, and is provided
                  to support the PRINTER command.
                  If registers D and E are both set to -1, this
                  function simply interrogates and returns the
                  current queue assignment and de-spool mode
                  for the specified printer.
```

T-FUNCTIONS

T-Function 30 Queue a Print File

T-Function 30	Queue a	Print File
Entry Arguments	Req	Description
	C = DE = H = 	30 FCB address print queue: 0 for queue A 1 for queue B : 15 for queue P
	L, = 	user number (0-31), plus bit 7 set to delete after printing
Returned Value	Reg	Description
	A =	0 if successful -1 if invalid request
Explanation	The Que text fi backgrou is iden fields the use	eue a Print File function enqueues a ile on a specified print queue for und printing. The file to be enqueued tified by the FCB drive, name and type (bytes 0 through 11), together with r number passed in register L.
	The dri sible by queue b invalid called case th checked	ve specified by the FCB must be acces- y the processor in which the specified resides, otherwise the request is d. To check this, the function may be with register L set to -1, in which he FCB drive and requested queue are for validity but no file is queued.

TurboDOS 1.3 Z80 Programmer's Guide

T-Function 31 Flush List Buffer

T-Function 31	Flush List Buffer
Entry Arguments	Reg Description C = 31
Explanation	The Flush List Buffer function is used by TurboDOS during direct printing over the network to force any remaining buffered char- acters to be printed. There should be no need for an application program to call this function.

T-FUNCTIONS

T-Function 32 Network List Out

T-Function 32	Network List Out
Entry Arguments	RegDescriptionC = 32E = output character
Explanation	The Network List Out function is used by TurboDOS during direct printing over the network. There should be no need for an

application program to call this function.

TurboDOS 1.3 Z80 Programmer's Guide

T-Function 33 Remote Console I/O

والمركز ويتها ويواد وينار ويور ويتبارك أنكر ويها ومناد المركز ويتورجون ويتبار ويتبار ويتبار	
T-Function 33	Remote Console I/O
Entry Arguments	Reg Description
	C = 33 E = console input character, or 0 if no console input available D = 0 to detach remote console -1 to attach remote console
Returned Value	RegDescriptionA = 0 if CONREM not present1 if successful-1 if executing in master
Explanation	The Remote Console I/O function works in conjunction with the CONREM console driver to support the MASTER command. It passes one byte of console input in register E (if available), and returns a count byte and up to 127 bytes of console output at the current DMA address. There should be no need for an application program to call this function.

T-FUNCTIONS

T-Function 34 Get Comm Status

an a	
T-Function 34	Get Comm Channel Status
Entry Arguments	Reg Description
	C = 34 D = channel number, plus bit 7 set if remote channel
Returned Value	Reg Description
	A = 0 if input character not available -1 if input character is available
Explanation	The Get Comm Channel Status function checks to see whether or not an input character is available on the specified comm channel. If a character is available, it returns $A = -1$. Otherwise, it returns $A = 0$.

T-Function 35 Comm Channel Input

```
T-Function 35
                 Comm Channel Input
                 Reg Description
Entry Arguments
                  C = 35
                   D = channel number, plus
                       bit 7 set if remote channel
Returned Value
                 Reg Description
                 A = input character
Explanation
                The Comm Channel Input function obtains the
                next input character from the specified comm
                channel, and returns in in register A. If no
                character is available, the calling program
                is suspended until a character is received.
```

TurboDOS 1.3 Z80

Programmer's Guide

T-FUNCTIONS

T-Function 36 Comm Channel Output

T-Function 36	Comm Channel Output
Entry Arguments	Reg Description
	C = 36 D = channel number, plus bit 7 set if remote channel E = output character
Explanation	The Comm Channel Output function outputs the character passed in register E on the speci-fied comm channel.

5-39

T-Function 37 Set Comm Baud Rate

T-Function 37 Set Comm Baud Rate Description Entry Arguments Req C = 37D = channel number, plus bit 7 set if remote channel E = baud rate code (bits 3-0):0 for 50 baud 8 for 1800 baud 1 for 75 baud 9 for 2000 baud 2 for 110 baud 10 for 2400 baud 3 for 134.5 baud 11 for 3600 baud 4 for 150 baud 12 for 4800 baud 5 for 300 baud 13 for 7200 baud 6 for 600 baud 14 for 9600 baud 7 for 1200 baud 15 for 19200 baud plus bit 7 set for att'n detection bit 6 set for CTS handshaking bit 5 set for input disabled The Set Comm Baud Rate function sets the baud Explanation rate and options passed in register E on the specified comm channel.

TurboDOS 1.3 Z80

Programmer's Guide

5-40

T-Function 38 Get Comm Baud Rate

Dubara Burnanda	Description
Entry Arguments	l description
	C = 38
	D = channel number, plus
	bit / set if remote channel
Returned Value	Reg Description
	A = baud rate code (bits $3-0$):
	$1 \text{ for } 75 \text{ band} \qquad 9 \text{ for } 2000 \text{ band}$
	2 for 110 baud 10 for 2400 baud
	3 for 134.5 baud 11 for 3600 baud
	4 for 150 baud 12 for 4800 baud
	5 for 300 baud = 13 for /200 baud
	7 for 1200 baud = 15 for 19200 baud
	plus bit 7 set for att'n detection
	bit 6 set for CTS handshaking
	bit 5 set for input disabled

register A.

TurboDOS 1.3 Z80 Programmer's Guide

T-Function 39 Set Modem Controls

T-Function 39	Set Modem Controls
Entry Arguments	RegDescriptionC = 39D = channel number, plus bit 7 set if remote channelE = modem control vector: bit 7 set for request-to-send bit 6 set for data-terminal-ready bits 5-0 unassigned
Explanation	The Set Modem Controls function sets the modem control signals in accordance with the vector passed in register E on the specified comm channel.

T-FUNCTIONS

T-Function 40 Get Modem Status

T-Function 40	
Entry Arguments	Reg Description
	C = 40 D = channel number, plus bit 7 set if remote channel
Returned Value	Reg Description
	A = modem status vector: bit 7 set for clear-to-send bit 6 set for data-set-ready bit 5 set for data-carrier-detect bit 4 set for ring-indicator bits 3-0 unassigned
Explanation	The Set Modem Status function interrogate the modem status signals for the specifie comm channel, and returns this information a

a vector in register A.

> T-Function 41 User-Defined Fcn

```
T-Function 41
                   User-Defined Function
Entry Arguments
                     Reg
                                     Description
                      C
                         = 41
                      B = network routing:
                             0 if always processed locally
                             ld hex if routed per drive d
                             2p hex if routed per printer p
                             3q hex if routed per queue q
                             -1 if routed to default net addr
                      DE = user-defined argument passed
                      HL = user-defined argument passed
Returned Value
                    Reg
                                      Description
                      A = user-defined value returned
                      BC = user-defined value returned
                      DE = user-defined value returned
                      HL = user-defined value returned
                   The User-Defined Function provides a means
Explanation
                   for adding user-defined extensions to the
                   operating system taking full advantage of the
                   TurboDOS networking facilities. On entry,
                   register B defines how the request is to be
                   routed over the network. Registers DE and HL
                   plus the 128-byte record at the current DMA
                   address are all passed (over the network if
                   necessary) to a user-defined module with the
                   public entrypoint symbol USRFCN. Upon entry
                   to the USRFCN routine, register BC contains
                   the address of the 128-byte record that was
                            The USRFCN routine may return
                   passed.
                   information to the caller in any of the seven
                   registers A-B-C-D-E-H-L and in the 128-byte
                   record.
```

TurboDOS 1.3 Z80 Programmer's Guide

T-Function 42 Reorg Disk Directory

T-Function 42	Reorganize Disk Directory
Entry Arguments	RegDescriptionC = 42E = disk drive:0 for drive A1 for drive B:15 for drive P
Returned Value	RegDescriptionA = 0 if successful-1 if disk write-protectedor has files open
Explanation	The Reorganize Disk Directory function reorg- anizes the directory on the disk drive speci- fied in register E. If the hashed-directory flag bit in the volume label has been changed, this function will convert a hashed directory into linear format (or vice versa). The principal purpose of this function is to support the FIXDIR command. NOTE: In certain cases, this function may take a very long time to complete (possibly
	hours), and cannot be interrupted once in- voked.
T-FUNCTIONS

TurboDOS 1.3 Z80 Programmer's Guide

T-Function 43 Select Memory Bank

T-Function 43	Select Memory Bank
Entry Arguments	Reg Description
	C = 43 E = 0 to select bank 0 1 to select bank 1 -1 to interrogate current bank
Returned Value	Reg Description
	A = current bank (0 or 1)
Explanation	The Select Memory Bank function selects the memory bank in which the TPA resides, accord- ing to the bank number (0 or 1) passed in register E. If $E = -1$, this function simply interrogates the current bank mode and returns the current bank number (0 or 1) in register A. This function is honored for privileged log-ons only, and is provided primarily to support the BANK command.
	This function has no effect in a non-banked system, and always shows that bank 0 is selected.

MONITOR Command	The MONITOR command provides various facili- ties under 280 TurboDOS useful to programmers who have the need to debug or patch programs and files.		
Syntax	MONITOR		
Explanation	The MONITOR command operates in an interac- tive mode. You are prompted by an asterisk * to enter a series of directives from the console. The Q directive (quit) terminates the MONITOR command.		
	all addresses and other numeric arguments are in hexadecimal, and all file names ("fn") are entered as {d:}filename{.typ}:		
Directives	Directive	Explanation	
	C v1,v2	Calculates the sum and dif- erence of two hex values.	
	D al,a2	Dumps the area of memory be- tween the two given addresses in hex. Pause with space, resume with RETURN.	
	E a	Examines memory starting at the given address. You may substitute a new hex value for each displayed byte of memory. Enter space or RE- TURN to go on to the next byte, or ESC to exit examine mode.	

Directives	Dj	rective	Explanation
(Continued)	F	al,a2{,v{,	<pre>,r}} Fills the area of memory be- tween the two given addresses with the given value v (or 0 if no value is given). If a repetition factor r is given,</pre>
			the operation is repeated r times (useful with some PROM programmers).
	G	a	Goes (jumps) to the instruc- tion at the given address.
	Н		Help menu is displayed, list- ing all MONITOR directives.
	I	p	Inputs a byte from I/O port p and displays its hex value.
	L	fn {a}	Loads the named file into memory starting at the given address (or 0100H if no ad- dress is given).
	M	al,a2,a3{,	<pre>nr} Moves the block of memory between al and a2 into the area starting at a3. If a repetition factor r is given, the operation is repeated r times (useful with some PROM programmers).</pre>
	0	p, v	Outputs the hex value v to I/O port p.
	P	a	Puts succeeding typed ASCII data into memory starting at the given address. Terminate by typing CTRL-D (ASCII EOT).

Directives (Continued)	Directive	Explanation
	Q	Quits the monitor command.
	R al,a2	RAM area between al and a2 is tested, and memory errors are diagnosed. Typing ESC aborts the test early.
	S fn {al,a2	Saves the area of memory be- tween the given addresses in the named file. If no memory a addresses are given, then the bounds from the last L (load) directive are used.
	T al,a2	Types the area of memory be- tween the given addresses in ASCII. Pause with space, re- sume with RETURN.
	V al,a2,a3	Verifies that the block of memory from al to a2 is iden- tical to the area starting at a3. Any descrepancies are diagnosed.
	W vl,,vN	Scans all of memory for oc- currences of the given byte string, and displays Where each occurrence is found.
i	Y	Displays the highest avail- able address in memory (below TurboDOS and the MONITOR com- mand code).
