

NAME

`mmkdir` — made path names

SYNOPSIS

`mmkdir` relative_path_name relative_path_name ...

DESCRIPTION

The `mmkdir` command will make all the directories in a relative path name input argument. If the directories already exist, then `mmkdir` does nothing. When successful, the relative path name for each input argument is printed on the standard output.

SEE ALSO

`mkdir(1)`

DIAGNOSTICS

All diagnostics are printed on file descriptor 2, and are hopefully self explanatory.
